

MICROCLOCK

MK2703 PLL Audio Clock Synthesizer

Description

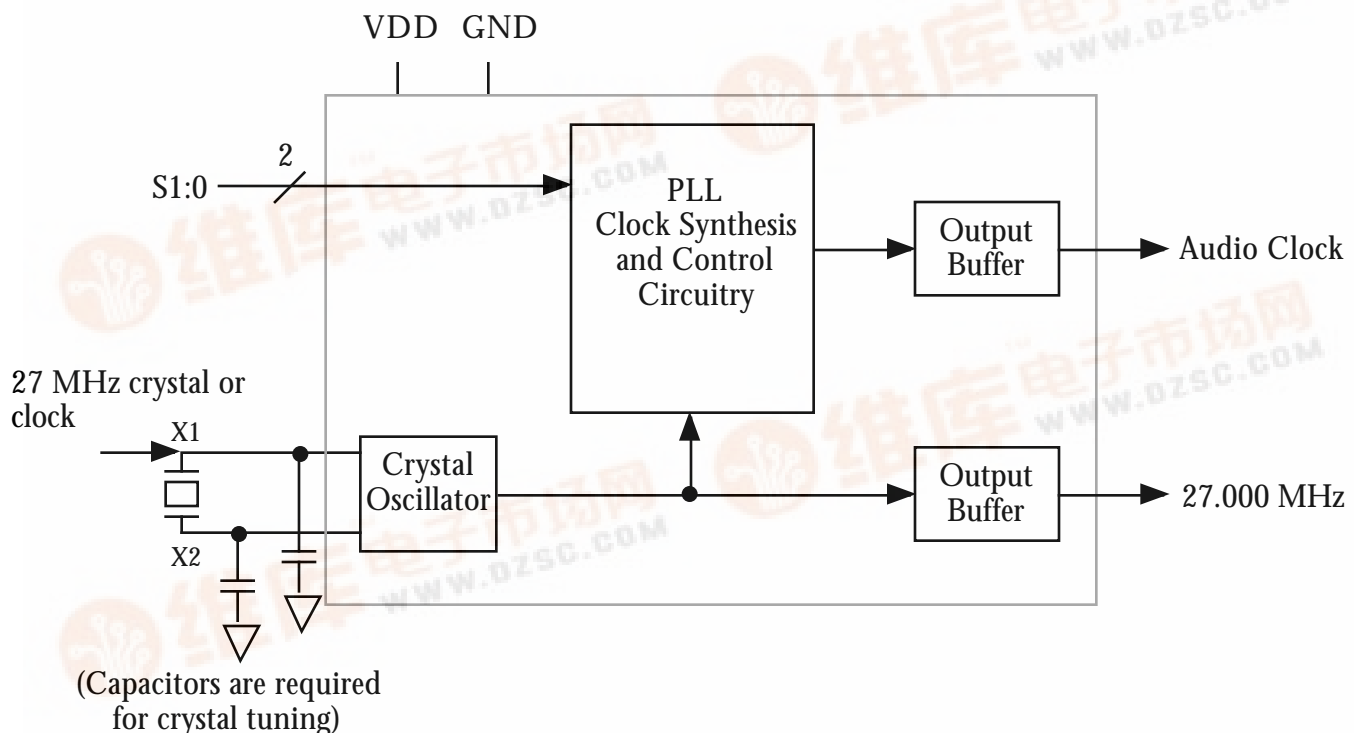

The MK2703 is a low cost, low jitter, high performance PLL clock synthesizer designed to replace oscillators and PLL circuits in set-top box and multimedia systems. Using our patented analog Phase-Locked Loop (PLL) techniques, the device uses a 27 MHz crystal or clock input to produce a buffered reference clock and a selectable audio clock.

MicroClock manufactures the largest variety of Set-Top Box and multimedia clock synthesizers for all applications. Consult MicroClock to eliminate VCXOs, crystals and oscillators from your board.

Features

- Packaged in 8 pin SOIC 
- Uses an inexpensive fundamental crystal, or clock
- Supports MPEG sampling rates of 32 kHz, 44.1 kHz, 48 kHz and 96 kHz
- Patented zero ppm synthesis error in all clocks
- All frequencies are frequency locked
- 25 mA output drive capability at TTL levels
- Advanced, low power, sub-micron CMOS process
- 3.3 V or 5 V operating voltage
- For audio clocks that require lower jitter, use the MK2731-03C

Notes: 1. Stresses beyond those listed under Absolute Maximum Ratings could cause permanent damage to the device. Prolonged exposure to levels above the operating limits but below the Absolute Maximums may affect device reliability.

External Components

The MK2703 requires a minimum number of external components for proper operation. For a crystal input, one load capacitor should be connected from each of the X1 and X2 pins to ground. The value (in pF) of each crystal load capacitor should equal $(C_L - 16) \cdot 2$, where C_L is the crystal's load (correlation) capacitance in pF. The input crystal must be connected as close to the chip as possible. The input crystal should be a parallel resonant, fundamental, AT cut 27 MHz. For a clock input, connect to X1 and leave X2 unconnected. Decoupling capacitors of 0.01μF should be connected between VDD and GND on pins 2 and 3, as close to the MK2703 as possible. A series termination resistor of 33 may be used for the clock output.
