

8-Chan/Dual 4-Chan JFET Analog Multiplexers (Overvoltage & Power Supply Loss Protected)

MUX-08/MUX-24

FEATURES

- JFET Switches Rather Than CMOS
- Low "ON" Resistance 220Ω Typ
- Highly Resistant to Static Discharge Damage
- No SCR Latch-Up Problems
- Digital Inputs Compatible With TTL and CMOS
- 125°C Temperature Tested Dice Available
- MUX-08 Pin Compatible With DG508, HI-508A, IH5108, IH6108, LF11508/12508/13508, AD7506
- MUX-24 Pin Compatible With DG509, HI-509A, IH5208, IH6208, LF11509/12509/13509, AD7507
- Available in Surface Mount Packages
- Available in Die Form

* For devices processed in total compliance to MIL-STD-883, add /883 after part number. Consult factory for 883 data sheet.

† Burn-in is available on commercial and industrial temperature range parts in CerDIP, plastic DIP, and TO-can packages.

** For availability and burn-in information on SO and PLCC packages, contact your local sales office.

GENERAL DESCRIPTION

The MUX-08 is a monolithic eight-channel analog multiplexer which connects a single output to one of the eight analog inputs depending upon the state of a 3-bit binary address.

The MUX-24 is a monolithic four-channel differential analog multiplexer configured in a double pole, four-position (plus OFF) electronic switch array. A two-bit binary input address connects a pair of independent analog inputs from each four-channel input section to the corresponding pair of independent analog outputs.

All switches in the MUX-08/MUX-24 are turned OFF by applying logic "0" to the ENABLE pin, thereby providing a package select function.

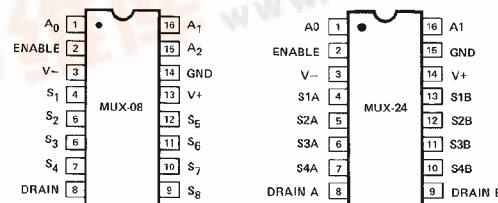

REV. A

Information furnished by Analog Devices is believed to be accurate and reliable. However, no responsibility is assumed by Analog Devices for its use, nor for any infringements of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of Analog Devices.

Fabricated with Precision Monolithics' high performance Bipolar-JFET technology, these devices offer low, constant "ON" resistance, low leakage currents and fast settling time with low crosstalk to satisfy a wide variety of applications. These multiplexers do not suffer from latch-up or static charge blow-out problems associated with similar CMOS parts. The digital inputs are designed to operate from both TTL and CMOS levels while always providing a definite break-before-make action without the need for external pull-up resistors over the full operating temperature range.

For single sixteen-channel and dual eight-channel models, refer to the MUX-16/MUX-28 data sheet.

ABSOLUTE MAXIMUM RATINGS (Note 1)

Operating Temperature Range

MUX-08/24-AQ, BQ, BRC	-55°C to +125°C
MUX-02/24-EQ, FQ	-25°C to +85°C
MUX-08/24-EP	0°C to +70°C
MUX-08/24-FP, FS	-40°C to +85°C
Junction Temperature (T_j)	-65°C to +150°C
Storage Temperature Range	-65°C to +150°C
P-Suffix	-65°C to +125°C
Lead Temperature (Soldering, 60 sec)	300°C
Maximum Junction Temperature	150°C
V+ Supply to V- Supply	36V
Logic Input Voltage	(-4V or V-) to V+ Supply

Analog Input Voltage V- Supply -20V to V+ Supply +20V
 Maximum Current Through Any Pin 25mA

PACKAGE TYPE	Θ_{JA} (Note 2)	Θ_{JC}	UNITS
16-Pin Hermetic DIP (Q)	100	16	°C/W
16-Pin Plastic DIP (P)	82	39	°C/W
20-Contact LCC (RC)	98	38	°C/W
16-Pin SO(S)	111	35	°C/W

NOTES:

- Absolute maximum ratings apply to both DICE and packaged parts, unless otherwise noted.
- Θ_{JA} is specified for worst case mounting conditions, i.e., Θ_{JA} is specified for device in socket for CerDIP, P-DIP, and LCC packages; Θ_{JA} is specified for device soldered to printed circuit board for SO package.

ELECTRICAL CHARACTERISTICS at $V_+ = +15V$, $V_- = -15V$ and $T_A = 25^\circ C$, unless otherwise noted.

NOTES:

- Conditions applied to leakage tests insure worst case leakages. Exceeding 11V on the analog input may cause an "OFF" channel to turn "ON".
- $R_L = 10M\Omega$, $C_L = 10pF$.
- Crosstalk is measured by driving channel 8 with channel 4 "ON". $R_L = 1M\Omega$, $C_L = 10pF$, $V_S = 5V$ RMS, $f = 500kHz$.
- "OFF" isolation is measured by driving channel 8 with ALL channels "OFF". $R_L = 1k\Omega$, $C_L = 10pF$, $V_S = 5V$ RMS, $f = 500kHz$. C_{DS} is computed from the OFF isolation measurement.
- Sample tested.
- Guaranteed by leakage current and R_{ON} tests.
- Leakage tests are performed only on military temperature grades at $125^\circ C$.

APPLICATIONS INFORMATION

These analog multiplexers employ ion-implanted JFETs in a switch configuration designed to assure break-before-make action. The turn-off time is much faster than the turn-on time to guarantee this feature over the full operating temperature and input voltage range. Fabricated with Bipolar-JFET processing, **special handling as required with CMOS devices, is not necessary to prevent damage to this multiplexer.** Because the digital inputs only require a 2.0V logic "1" input level, power-consuming pull-up resistors are not required for TTL compatibility to insure break-make switching as is most often the case with CMOS multiplexers. The digital inputs utilize PNP input transistors where input current is maximum at the logic "0" level and drops to that of a reverse-biased diode (about 10nA) as the input voltage is raised above $\approx 1.4V$.

The "ON" resistance, R_{ON} , of the analog switches is constant over the wide input voltage range of $-15V$ to $+11V$ with $V_{SUPPLY} = \pm 15V$. Higher input voltage is tolerable provided that some form of current limiting is employed (such as that of an op-amp output stage) to avoid exceeding junction temperature and power dissipation requirements. For normal operation, however, positive input voltages should be restricted to $11V$ (or $4V$ less than the positive supply). This assures that the V_{GS} of an "OFF" switch remains greater than its V_p , and prevents that channel from being falsely turned "ON". When operating with negative input voltages, the gate-to-channel diode will be turned on if the voltage drop across an "ON" switch exceeds $-0.6V$. While this condition will cause an error in the output, it will not damage the switch. In lab tests, the multiplexer output has been loaded with a $0.01\mu F$ capacitor in the circuit of Figure 1. With $V_1 = -10V$ and $V_8 = +10V$, the logic input was driven at a $1kHz$ rate. The positive-going slew rate was $0.3V/\mu s$ which is equivalent to a normal I_{DSS} of $3mA$. The negative-going slew rate was $0.7V/\mu s$ which is equivalent to a "reverse" I_{DSS} of $7mA$. Note that when switch 1 is first turned "ON" it has a drop of $-20V$ across its terminals. In spite of that fact, the current is limited to approximately twice its normal I_{DSS} .

CROSSTALK AND OFF-ISOLATION

Crosstalk and off-isolation performance is influenced by the type of package selected. Epoxy (P) packaged devices typically exhibit a $12dB$ improvement in off-isolation ($f = 500kHz$) performance when compared to ceramic (Q) packaged devices. Epoxy packaged devices typically exhibit a $15dB$ improvement in crosstalk ($f = 500kHz$) performance when compared to ceramic (Q) packaged devices.

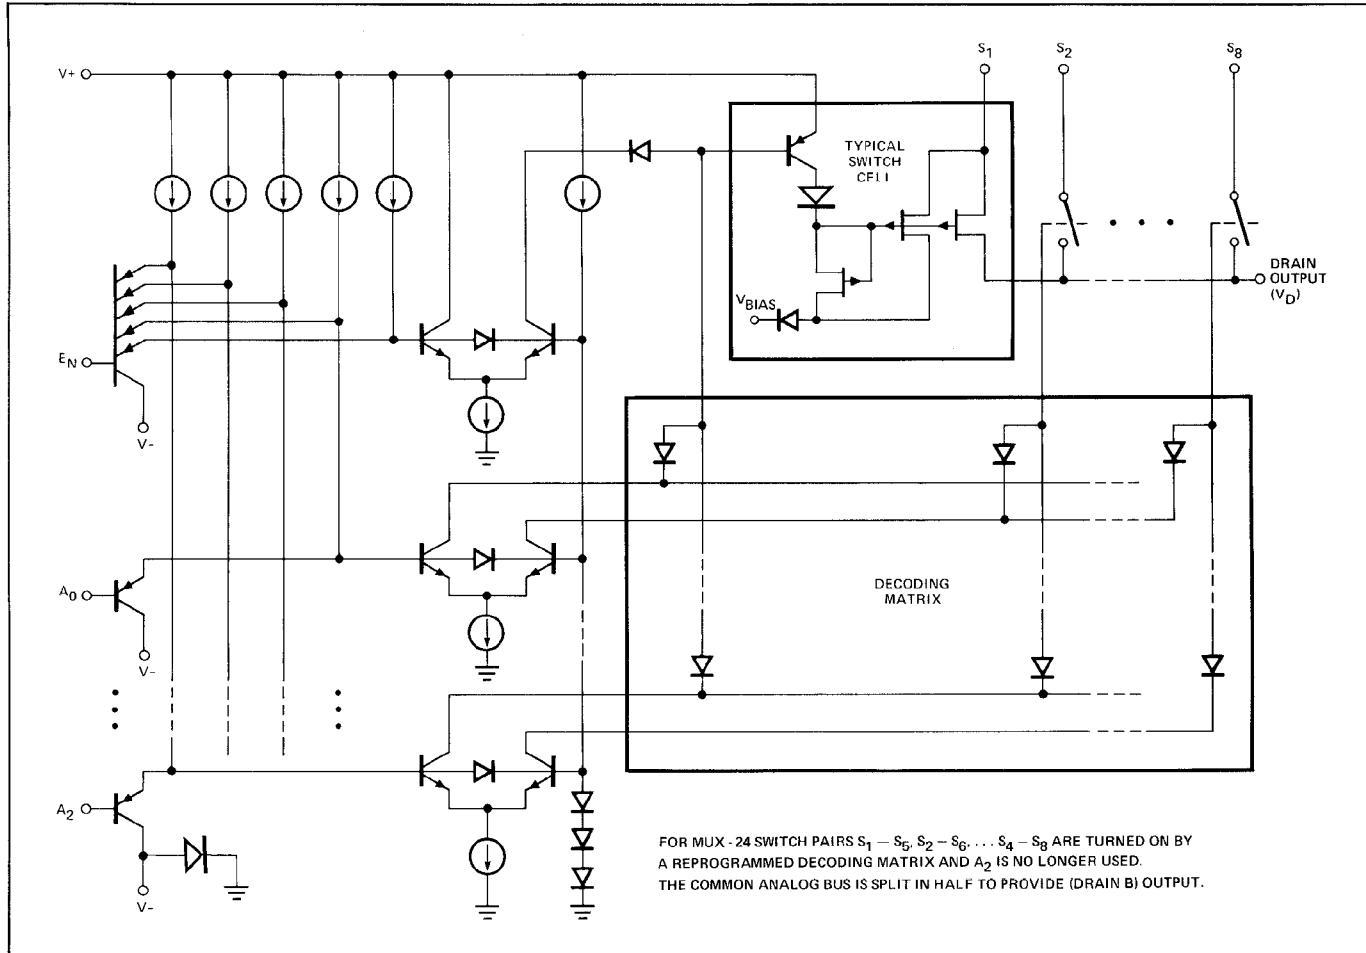

SINGLE SUPPLY OPERATION OF JFET MULTIPLEXERS

PMI's JFET multiplexers will operate from a single positive supply voltage with the negative supply pin at ground potential. The analog signal range will include ground.

For complete single supply operation information, refer to application note, AN-32.

MUX-08/MUX-24

SIMPLIFIED MUX-08 SCHEMATIC

The simplified MUX-08/MUX-24 schematic shows that logic trip points are determined by two forward diode drops. An internal clamping diode between V_- and ground prevents excessive current flow between V_+ and ground in the event that V_- becomes open circuit. The decoding matrix is accomplished by a programmed diode array. The switch cell consists of P channel JFET's with appropriate blocking diodes which ruggedizes the circuit's overvoltage and supply loss characteristics.

DIFFERENTIAL MULTIPLEXERS

One characteristic unique to differential multiplexers (MUX-24) is the ability to reject common-mode signals from becoming differential error signals. Common-mode rejection is a parameter which defines the amount of rejection in terms of dB. The MUX-24 exhibits a 106dB at 60Hz and 101dB at 400Hz of CMRR using the test circuit of Figure 6.
