NTE1171 Integrated Circuit Operational Amplifier

Description:

The NTE1171 is a general purpose operational amplifier in an 8-Lead Metal Can type package. Advanced processing techniques make possible an order of magnitude reduction in input currents, and a redesign of the biasing circuitry reduces the temperature drift of the input current.

This amplifier offers many features which make its application nearly foolproof: overload protection on the input, no latch-up when the common mode range is exceeded, freedom from oscillations and compensations with a single 30pF capacitor. It has advantages over internally compensated amplifiers in that the frequency compensation can be tailored to the particular application. For example, in low frequency circuits it can be overcompensated for increased stability margin. Or the compensation can be optimized to give more than a factor of ten improvement in high frequency performance for most applications.

Feature:

- Low Input Offset Current: 20na Maximum Over Temperature Range
- External Frequency Compensation for Flexibility
- Class AB Output Provides Excellent Linearity
- Output Short-Circuit Protection
- Guaranteed Drift Characteristics

Absolute Maximum Ratings:

Power Supply Voltage, V_{CC}, V_{EE}	$\pm 18V$
Input Differential Voltage, V_{ID}	$\pm 30V$
Input Common-Mode Range (Note 1), V_{ICR}	$\pm 15V$
Output Short-Circuit Duration, t_S	Continuous
Power Dissipation (Package Limitation, $T_A = +25^\circ C$), P_D	500mW
Derate Above $T_A = +75^\circ C$	6.8mW/ $^\circ C$
Operating Ambient Temperature Range, T_A	0° to $+70^\circ C$
Storage Temperature Range, T_{stg}	-65° to $+150^\circ C$

Note 1: For supply voltages less than $\pm 15V$, the absolute maximum input voltage is equal to the supply voltage.
