

MAXIM

Precision Low Voltage Micropower Operational Amplifier

OP90

General Description

The OP90 is a precision bipolar micropower operational amplifier with flexible power supply capability. Both the input voltage range and output voltage swing of the OP90 include the negative rail, allowing "ground-sensing" operation when the part is driven from a single positive voltage supply. The OP90 will accept a single power supply voltage of any value in the range +1.6V to +36V. Alternatively, the amplifier can be operated from dual power supplies in the range of $\pm 0.8V$ to $\pm 18V$.

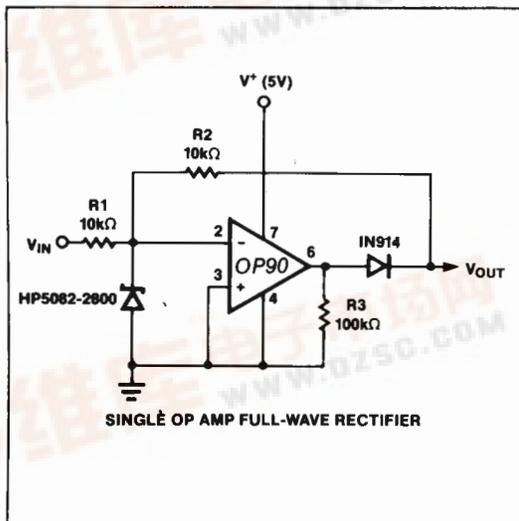

Unlike most other micropower operational amplifiers, the OP90 requires no external current setting resistor, and consumes less than $20\mu A$ of quiescent current, allowing operation from a lithium battery of greater than 10,000 hours. Even with this minimal current consumption, the amplifier can sink or source 5mA of current into the load.

Every OP90 (A/E grade) is internally trimmed to guarantee an input offset voltage of less than $150\mu V$. This eliminates the need for external nulling in most applications, although null pins are provided if required. The guaranteed minimum open loop gain of 700,000 together with power supply rejection ratio of $5.6\mu V/V$ and common-mode rejection ratio of 100dB allow the OP90 to be used in applications requiring low power operation together with precision performance.

Applications

- Precision Micropower Amplifiers
- Micropower Signal Processing
- Battery Powered Analog Circuits

Typical Operating Circuit

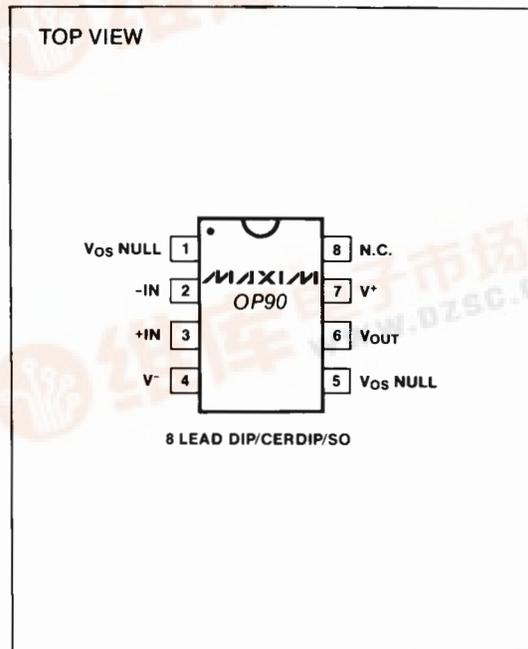

Features

- ◆ Single/Dual Supply Operation: +1.6V to +36V, $\pm 0.8V$ to $\pm 18V$
- ◆ True Single-Supply Operation: Input and Output Voltage Ranges Include Ground
- ◆ Low Supply Current: $20\mu A$ Max
- ◆ High Output Drive: 5mA Min
- ◆ Low Input Offset Voltage: $150\mu V$ Max
- ◆ High Open Loop Gain: 700V/mV Min
- ◆ High PSRR: $5.6\mu V/V$ Max
- ◆ Standard 741 Pin Out With Nulling to V⁻

Ordering Information

PART	TEMP. RANGE	PACKAGE
OP90AZ	-55°C to +125°C	8 Lead CERDIP
OP90EZ	-25°C to +85°C	8 Lead CERDIP
OP90FZ	-25°C to +85°C	8 Lead CERDIP
OP90GP	0°C to +70°C	8 Lead Plastic DIP
OP90GS	0°C to +70°C	8 Lead SO
OP90GC/D	0°C to +70°C	Dice

Pin Configuration

Precision Low Voltage Micropower Operational Amplifier

ABSOLUTE MAXIMUM RATINGS (Note 1)

Supply Voltage (V^+ to V^-)	$\pm 18V$	Storage Temperature Range	$-65^\circ C$ to $+150^\circ C$
Internal Power Dissipation	500mW	Operating Temperature Range	
Hermetic DIP (Z) — derate at $7.1mW/^\circ C$ above $+80^\circ C$		OP90A	$-55^\circ C$ to $+125^\circ C$
Plastic DIP (P) — derate at $5.6mW/^\circ C$ above $+36^\circ C$		OP90E, OP90F	$-25^\circ C$ to $+85^\circ C$
Small Outline (S) — derate at $5mW/^\circ C$ above $+55^\circ C$		OP90G	$0^\circ C$ to $+70^\circ C$
Differential Input Voltage	$[(V^-)-20V]$ to $[(V^+)+20V]$	Junction Temperature (T_J)	$-65^\circ C$ to $+160^\circ C$
Common Mode Input Voltage	$[(V^-)-20V]$ to $[(V^+)+20V]$	Lead Temperature (Soldering, 10 sec)	$+300^\circ C$
Output Short Circuit Duration	Indefinite		

Note 1: Absolute maximum ratings apply to both packaged parts and Dice, unless otherwise noted.

Stresses above those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions above those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

ELECTRICAL CHARACTERISTICS

($V_S = \pm 1.5V$ to $\pm 15V$, $T_A = +25^\circ C$, unless otherwise noted.)

Power Supply Rejection Ratio	PSRR				10	$\mu V/V$
Supply Current	I_{SY}	$V_S = \pm 15V$			20	μA

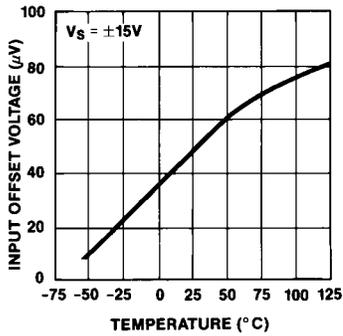

Note 6: Guaranteed by CMRR test.

Electrical tests are performed at wafer probe to the limits shown. Due to variations in assembly methods and normal yield loss, yield after packaging is guaranteed for standard product dice. Consult factory to negotiate specifications based on dice lot qualification through sample lot assembly and testing.
