

# LP3927 Cellular/PCS System Power Management IC **General Description**

The LP3927 system power management IC is designed for cellular/PCS handsets as well as other portable systems that require intelligent power management. Each device contains five low-dropout linear regulators (LDO's), a reset timer, a power-up control logic, a general-purpose open drain output that can be used to light LEDs, and a CMOS rail-to-rail input/output operational amplifier.

Each linear regulator features an extremely low dropout voltage of 100 mV (typ) at maximum output current. LDO1 and LDO2 are powered on and off by either the KYBD or the VEXT pin. LDO3, LDO4 and LDO5 each have its independent enable pin. LDO1 and LDO4 are rated at 150 mA each, LDO2 and LDO5 are rated at 200 mA each and LDO3 is rated at 100 mA. All LDO's are optimized for low noise and high isolation.

The open drain output current sink can be programmed up to 150 mA by using an external low cost resistor.

A single supply, low voltage operational amplifier has rail to rail input and output with 600 kHz of gain-bandwidth product.

# **Key Specifications**

- 3.0V to 5.5V Input Voltage Range
- Two 200 mA, Two 150 mA and One 100 mA LDO's
- 100 mV typ Dropout Voltage @ I<sub>MAX</sub>
- 150 mA General-Purpose Open-drain programmable current sink for back light LED
- Low Voltage Rail to Rail Input/Output Operational Amplifier
- 28 pin LLP package

### Applications

- Cellular/PCS handsets
- PDA's, Palmtops, and portable terminals
- Single-Cell Li+ Systems
- 2- or 3- Cell NiMH, NiCd or Alkaline System

August 2002

### **Output Current Rating and Voltage Options**

	I <sub>MAX</sub> (mA)	Voltage Options (V)
LDO1	150	1.8, 1.9, 2.5, 2.6*, 2.7
LDO2	200	1.8, 2.85*, 2.9, 3.0
LDO3	100	2.7, 2.8, 2.9*, 3.0
LDO4	150	2.7, 2.8, 2.9*, 3.0
LDO5	200	2.7, 2.8, 2.9, 3.0*

 $^\ast$  denotes the voltage options that are available currently. For other options, please contact the National Semiconductor factory sales office/distributors for availability and specifications.

## **Ordering Information**

LP3927 Supplied as 1000 Units, tape and reel	LP3927 Supplied as 4500 Units, tape and reel	Standard LDO delay	Optional LDO delay	VO1 (V)	VO2 (V)	VO3 (V)	VO4 (V)	VO5 (V)	TOP MARKING
LP3927ILQ-AH	LP3927ILQX-AH		Х	26	2.95	2.0	2.0	2.0	3927AH
LP3927ILQ-AJ	LP3927ILQX-AJ	Х		2.0	2.85	2.9	2.9	3.0	3927AJ

For LDO delay options, please refer to Electrical Characteristics Table.

Pin D	escription	
Pin	Name	Functional Description
1	VO1	150 mA, LDO1 output pin.
2	EN5	LDO5 enable input.
3	EN4	LDO4 enable input.
4	EN3	LDO3 enable input.
5	RST	Externally pulled high, open drain output to processor/memory reset.
6	ĪRQ	Externally pulled high, open drain output to processor interrupt indicating KYBD has gone high.
7	PS_HOLD	Input from the processor to the LP3927. A HIGH indicates a steady supply of power is granted. Refer to 'Application Hints' section for more detail.
8	KYBD	An active high input signal indicating the keyboard "On/Off" button has been asserted. Refer to 'Application Hints' section for more detail.
9	D_GND	Digital ground, used primarily for the digital and DAC circuits.
10	VEXT	Active low input indicating a battery charger insertion Refer to 'Application Hints' section for more detail.
11	BYP	Reference bypass pin.
12	TEST_MODE	Pin used for production testing, factory use only. This pin should be grounded in applications.
13	LED_EN	LED driver enable input.
14	LED	LED driver, drain connection of the LED drive MOSFET.
15	LED_PGM	LED drive current programming pin.
16	OP_AMP_OUT	Operational amplifier output pin.
17	IN–	– input of the Op-Amp.
18	IN+	+ input of the Op-Amp.
19	OP_AMP_V <sub>DD</sub>	Power supply pin for Op-Amp.
20	A_GND2	Ground for analog.
21	VO5	200 mA, LDO5 output pin.
22	V <sub>DD3</sub>	Input power pin for LDO5. $V_{DD1}$ , $V_{DD2}$ and $V_{DD3}$ must be tied together externally.
23	VO4	150 mA, LDO4 output pin.
24	V <sub>DD2</sub>	Input power pin for LDO3 and LDO4. $V_{DD1}$ , $V_{DD2}$ and $V_{DD3}$ must be tied together externally.
25	VO3	100 mA, LDO3 output pin.
26	A_GND1	Ground for analog.
27	VO2	200 mA, LDO2 output pin.
28	V <sub>DD1</sub>	Input power pin for LDO1 and LDO2. $V_{DD1}$ , $V_{DD2}$ and $V_{DD3}$ must be tied together externally.

GBW	Gain-Bandwidth Product		0.6			MHz

Note 1: Absolute Maximum Ratings are limits beyond which damage to the device may occur. Operating Ratings are conditions under which operation of the device is guaranteed. Operating Ratings do not imply guaranteed performance limits. For guaranteed performance limits and associated test conditions, see the Electrical Characteristics tables.

Note 2: All voltages are with respect to the potential at the GND pin.

Note 3: The Absolute Maximum power dissipation depends on the ambient temperature and can be calculated using the formula

#### $\mathsf{P} = (\mathsf{T}_{\mathsf{J}} - \mathsf{T}_{\mathsf{A}})/\theta_{\mathsf{J}\mathsf{A}},$

where  $T_J$  is the junction temperature,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the junction-to-ambient thermal resistance. The 2.6W rating appearing under Absolute Maximum Ratings results from substituting the Absolute Maximum junction temperature, 150°C, for  $T_J$ , 70°C for  $T_A$ , and 30.8°C/W for  $\theta_{JA}$ . More power can be dissipated safely at ambient temperatures below 70°C. Less power can be dissipated safely at ambient temperatures above 70°C. The Absolute Maximum power dissipation can be increased by 32.5 mW for each degree below 70°C, and it must be derated by 32.5 mW for each degree above 70°C.

Note 4: The human-body model is used. The human-body model is 100 pF discharged through 1.5 k $\Omega$ .

Note 5: This figure is taken from a thermal modeling result. The test board is a 4 layer FR-4 board measuring 101mm x 101mm x 1.6mm with a 3 x 3 array of thermal vias. The ground plane on the board is 50mm x 50mm. Ambient temperature in simulation is 22°C, still air. Power dissipation is 1W.

**Note 6:** Like the Absolute Maximum power dissipation, the maximum power dissipation for operation depends on the ambient temperature. The 1.78W rating appearing under Operating Ratings results from substituting the maximum junction temperature for operation, 125°C, for  $T_J$ , 70°C for  $T_A$ , and 30.8°C/W for  $\theta_{JA}$  into (1) above. More power can be dissipated at ambient temperatures below 70°C. Less power can be dissipated at ambient temperatures above 70°C. The maximum power dissipation for operation for operation can be increased by 32.5 mW for each degree below 70°C, and it must be derated by 32.5 mW for each degree above 70°C.

Note 7: All limits guaranteed at room temperature (standard typeface) and at temperature extremes (bold typeface). All room temperature limits are 100% production tested or guaranteed through statistical analysis. All limits at temperature extremes are guaranteed via correlation using standard Statistical Quality Control (SQC) methods.

Note 8: The target output voltage, which is labeled V<sub>OUT(target)</sub>, is the desired or ideal output voltage.

**Note 9:** Dropout voltage is the input-to-output voltage difference at which the output voltage is 100 mV below its nominal value. This specification does not apply in cases it implies operation with an input voltage below the 2.5V minimum appearing under Operating Ratings. For example, this specification does not apply for devices having 1.5V outputs because the specification would imply operation with an input voltage at or about 1.5V.

Note 10: Pulsing the load of LDO X from 100µA to Imax and measuring its effects at the output of LDO Y. LDO Y enabled but under no load.

Note 11: The error flags are internal to the chip. There is no external access to the signals. LDO1 error flag and the LDO2 error flag will go HIGH when the respective LDO reaches its  $V_{Th-H}$  value. The error flags will go LOW when the respective LDO reaches its  $V_{Th-L}$  value.

Note 12: The  $t_{DELAY-H}$  is the delay between LDO1 reaching its  $V_{Th-H}$  and its error flag going HIGH. The  $t_{DELAY-L}$  is the delay between LDO1 reaching its  $V_{Th-L}$  and its error flag going LOW. Same delays apply to LDO2 and its error flag.

Note 13: Refer to Timing Diagram.

Note 14: The delay between LDO2 error flag HIGH and  $\overline{\text{RST}}$  signal HIGH in the power up sequence. In the power down sequence, it is the delay between  $\overline{\text{RST}}$  signal LOW and LDO2 disabled.

Note 15: The delay between LDO1 error flag HIGH and LDO2 enable in power up sequence. In the power down sequence, it is the delay between LDO2 error flag LOW and LDO1 disable. For the optional LDO delay, please contact the factory for availability.

7

- 11. Delay between LDO2 disable and LDO1 disabled.

# **Application Hints**

### LP3927 Function Description

The LP3927 is designed for cellular/PCS handsets. The LDOs power the microprocessor, RF and digital sections of the phone. When a KYBD debounce of longer than 32 ms is detected by the LP3927, the IRQ signal is asserted and sent to the microprocessor. In addition, the KYBD signal turns on LDO1. When LDO1 reaches 95% of its output voltage option, a 125  $\mu$ s delay (standard LDO delay. The optional LDO delay has a 10msec delay) takes place, and LDO2 turns on. When LDO2 reaches 95% of its output voltage option, RST goes high after a 20 ms delay. At this point, the microprocessor comes out of reset and the LP3927 starts the PS\_H-OLD timer. If PS\_HOLD goes high before 500 ms, IRQ is de-asserted. If PS\_HOLD stays low for longer than 500 ms, IRQ will still de-assert, but RST will also be asserted, and the part will power down.

The power down sequence is the exact reverse of the power up sequence. PS\_HOLD from the microprocessor goes low, indicating a request to turn the part off. This causes  $\overline{\text{RST}}$  to go low. LDO2 will be turned off after a 20 ms delay. When LDO2 drops to 90% of its output voltage option, LDO1 will start to turn off after a 125  $\mu s$  (or a 10msec) delay. Another KYBD debounce after power up does not necessary mean power down.

Whenever LDO1 or LDO2 falls under 90% of the output voltage option, RST immediately goes low to bring PS\_HOLD low in order to turn the part off.

Plugging the charger into the cell phone will cause an external signal  $\overline{VEXT}$  to toggle from high to low. The LP3927 will respond differently to this signal depending on the scenario:

Case 1: If a charger is plugged into the cell phone after the phone is already on, the VEXT signal go from high to low. The LP3927 will acknowledge this signal but all other signals remain unchanged.

Case 2: If a charger is plugged into the phone while the phone is off,  $\overline{\text{VEXT}}$  signal goes from high to low and the LP3927 will proceed to turn LDO1 on after a 32 ms delay, and the identical power-up sequence follows. This case bypasses the power-up initiated by KYBD and  $\overline{\text{IRQ}}$ . KYBD remains low and  $\overline{\text{IRQ}}$  remains high at all time during power-up.

When the charger is plugged in, the phone cannot be turned off unless both VEXT goes high and PS\_HOLD goes low.

### LDOs

The LP3927 contains five LDOs. LDO1 and 2 are powered by the V<sub>DD1</sub> line; LDO3 and 4 are powered by the V<sub>DD2</sub> line; and LDO5 is powered by the V<sub>DD3</sub> line. V<sub>DD1</sub>, V<sub>DD2</sub> and V<sub>DD3</sub> must be tied together externally. All five LDOs accept an input voltage from 3.0V to 5.5V. This accommodates the full usable range of a single Li-On battery.

LDO1 and 4 each provide 150 mA of current. LDO2 and 5 each provide 200 mA of current. LDO3 provides 100 mA of current. The output of each LDO can be programmed to different voltage levels at the factory. Refer to "Output Current Rating and Voltage Options" Table for more details.

### LDO Input Capacitor

An input capacitance of  $\approx 2.2~\mu F$  is required between each  $V_{DD}$  input pins and ground. (The amount of the capacitance may be increased without limit).

This capacitor must be located a distance of not more than 1 cm from the input pin and returned to a clean analog ground. Any good quality ceramic, tantalum, or film capacitor may be used at the inputs.

**Important:** Tantalum capacitors can suffer catastrophic failures due to surge current when connected to a low-impedance source of power (like a battery or a very large capacitor). If a tantalum capacitor is used at the input, it must be guaranteed by the manufacturer to have a surge current rating sufficient for the application.

There are no requirements for the ESR on the input capacitor, but tolerance and termperature coefficient must be considered when selecting the capacitor to ensure the capacitance will be  $\approx$  1  $\mu F$  over the entire operating temperature range.

### LDO Output Capacitor

The LDOs are designed specifically to work with very small ceramic output capacitors. A ceramic capacitor (X7R, X5R, Z5U, or Y5V) in 1  $\mu F$  to 20  $\mu F$  range with 5 m $\Omega$  to 500 m $\Omega$  ESR range is suitable in the LP3927 application circuit.

It may also be possible to use tantalum or film capacitors at the output, but these are not as attractive for reasons of size and cost.

The output capacitor must meet the requirement for minimum amount of capacitance and also have an ESR (Equivalent Series Resistance) value which is within a stable range (5 m $\Omega$  to 500 m $\Omega$ ).

### LED Current Driver

The LED pin on the LP3927 is an open-drain output that can provide up to 150 mA to drive backlight LEDs. It is turned on when the LED\_EN pin is pulled high, and off when the LED\_EN pin is pulled low. The external resistor R<sub>PGM</sub> connected to the LED\_PGM pin programs the output current of LED. A 130 k $\Omega$  resistor sets the output current to 150 mA. An *approximated* equation between R<sub>PGM</sub> and I<sub>LED</sub> is:

$$LED = \frac{19235}{R_{PGM}}$$

### **Operational Amplifier**

The LP3927 has an internal op amp with rail-to-rail input and output and a 600 kHz of gain-bandwidth product.

### Leadless Leadframe Package (LLP)

T

The LP3927 is packaged in a 28-lead LLP package for enhanced thermal performance. The 28-lead LLP measures 5 mm x 5 mm x 0.75 mm. Its small size and low profile is ideal for handset applications and other portable applications that require power management.

### **Thermal Performance**

The LLP package is designed for enhanced thermal performance because of the exposed die attach pad at the bottom center of the package. It brings advantage to thermal performance by creating a very direct path for thermal dissipation. Compared to the traditional leaded packages where the die attach pad is embedded inside the mold compound, the LLP reduces a layer in the thermal path.

The thermal advantage of the LLP package is fully realized only when the exposed die attach pad is soldered down to a thermal land on the PCB board and thermal vias are planted underneath the thermal land. Based on a LLP thermal mea-

### Application Hints (Continued)

surement, junction to ambient thermal resistance ( $\theta_{JA}$ ) can be improved by as much as two times if a LLP is soldered on the board with thermal land and thermal vias than if not. Consider the following equation:

$$P = \frac{(T_J - T_A)}{\theta_{JA}}$$

Where P is the power dissipated,  $T_J$  is the maximum junction temperature of the die,  $T_A$  is the ambient temperature, and  $\theta_{JA}$  is the thermal resistance of the package.  $T_J$  is specified at 150°C.

According to the above equation, in the case where the LP3927 is dissipating 3W of power,  $T_A$  is limited to 32.6°C when  $T_J$  of 125°C and  $\theta_{JA}$  of 30.8°C/W are used in the equation. In order to operate at a higher ambient temperature, power dissipation has to be reduced. A curve of maximum power dissipation vs ambient temperature is provided below.

### Layout Consideration

The LP3927 has an exposed die attach pad located at the bottom center of the LLP package. It is imperative to create a thermal land on the PCB board when designing a PCB layout for the LLP package. The thermal land helps to conduct heat away from the die, and the land should be the same dimension as the exposed pad on the bottom of the LLP (1:1 ratio). The land should be on both the top and the bottom layer of the PCB board. In addition, thermal vias should be added inside the thermal land to conduct more heat away from the surface of the PCB to the ground plane. Typical pitch and outer diameter for these thermal vias are 1.27 mm and 0.33 mm respectively. Typical copper via barrel plating is 1 oz. although thicker copper may be used to improve thermal performance. The LP3927 bottom pad is connected to ground. Therefore, the thermal land and vias on the PCB board need to be connected to ground.

For more information on board layout techniques, refer to Application Note 1187 "Leadless Leadframe Package (LLP)." The application note also discusses package handling, solder stencil, and assembly process.
