#### Product Description

A monolithic, high-efficiency, silicon-germanium power amplifier IC, the PA2423L is designed for class 1 Bluetooth™ 2.4 GHz radio applications. It delivers +22.5 dBm output power with 45% power-added efficiency – making it capable of overcoming insertion losses of up to 2.5 dB between amplifier output and antenna input in class 1 Bluetooth™ applications.

The amplifier features:

- ❑ an analog control input for improving PAE at reduced output power levels;
- ❑ a digital control input for controlling power up and power down modes of operation.

An on-chip ramping circuit provides the turn-on/off switching of amplifier output with less than 3dB overshoot, meeting the Bluetooth™ specification 1.1.

The PA2423L operates at 3.3V DC. At typical output power level (+22.5 dBm), its current consumption is 125 mA.

The silicon/silicon-germanium structure of the PA2423L – and its exposed-die-pad package, soldered to the system PCB – provide high thermal conductivity and a subsequently low junction temperature. This device is capable of operating at a duty cycle of 100 percent.

### Using V<sub>RAMP</sub>

V<sub>RAMP</sub> is a digital pin used to power-up and power-down the PA2423L in Time Duplex systems such as Bluetooth™ 1.1. During receive mode, V<sub>RAMP</sub> voltage is pulled down, PA2423L acts as a 25 dB isolation block between the radio and the antenna while consuming a modest 1uA. In transmit mode, V<sub>RAMP</sub> voltage is pulled to VCC and PA2423L offers 19 dB to 21dB of large signal gain. The rise and fall time are in the order of 1-2uSec.

#### **Using $V_{CTL}$**

$V_{CTL}$  is an analog pin that is designed to control the gain of PA2423L. Applying a voltage between 0V and  $V_{CC}$  will adjust the gain between -15dB and 21 dB. Used in combination with a variable drive level to PA2423L, the  $V_{CTL}$  function can greatly optimize the PAE of the system at all four Bluetooth™ transmitted power levels.

By applying approximately 1.4V to  $V_{CTL}$ , for example, a Class1 radio can be modified to a Class2 radio with the PA2423L consuming only 15mA.

By implementing a resistor DAC, the  $V_{CTL}$  pin can interface with Bluetooth™ transceivers offering digital and programmable outputs.
