

HIGH VOLTAGE POWER OPERATIONAL AMPLIFIER

PA45

HTTP://WWW.APEXMICROTECH.COM (800) 546-APEX (800) 546-2739

FEATURES

- MONOLITHIC MOS TECHNOLOGY
- LOW COST
- HIGH VOLTAGE OPERATION—150V
- HIGH SLEW RATE—27V/ $\mu$ s
- HIGH POWER—5A, 85W DISSIPATION

APPLICATIONS

- MAGNETIC DEFLECTION
- PA AUDIO
- MOTOR DRIVE
- NOISE CANCELLATION

DESCRIPTION

The PA45 is a high power monolithic MOSFET operational amplifier that achieves performance levels unavailable even in many hybrid amplifier designs. Inputs are protected from excessive common mode and differential mode voltages as well as static discharge. The safe operating area (SOA) has no second breakdown limitations and can be observed with all type loads by choosing an appropriate current limiting resistor. External compensation provides the user flexibility in choosing optimum gain and bandwidth for the application.

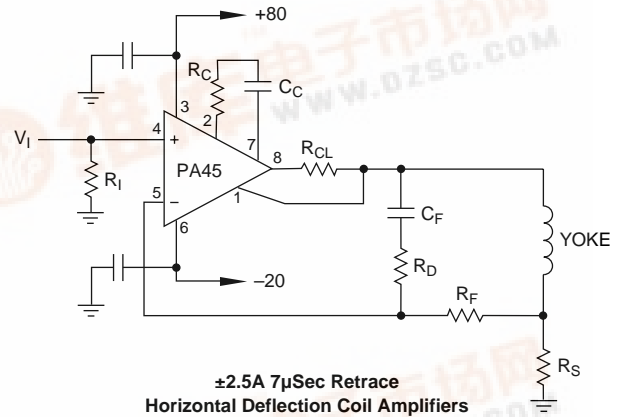

This circuit utilizes a beryllia (BeO) substrate to minimize thermal resistance. Ultrasonically bonded aluminum wires provide reliable interconnections at all operating temperatures. The 8-pin TO-3 package is hermetically sealed and electrically isolated. The use of compressible isolation washers and/or improper mounting torque will void the product warranty.

EQUIVALENT SCHEMATIC

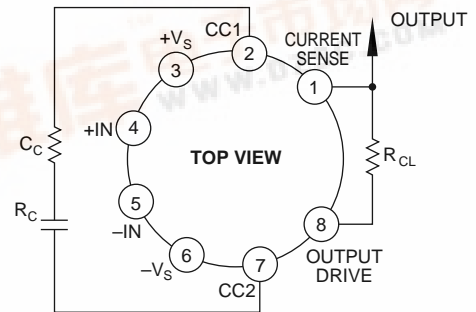

PATENTED

TYPICAL APPLICATION

Horizontal deflection amplifiers require both high speed and low distortion. The speed at which current can be changed in a deflection coil is a function of the voltage available from the op amp. In this application an 80 volt power supply is used for the retrace polarity to provide a 7  $\mu$ Sec retrace time, half of which is required for amplifier slewing. This circuit can perform 15.75 KHz deflection in up to 50 $\mu$ H coils at up to 5A p-p.

EXTERNAL CONNECTIONS

C<sub>c</sub> IS NPO RATED FOR FULL SUPPLY VOLTAGE.

PHASE COMPENSATION		
Gain	C <sub>c</sub>	R <sub>c</sub>
≥10	10pF	1K $\Omega$
≥1	68pF	1K $\Omega$

# PA45

## ABSOLUTE MAXIMUM RATINGS SPECIFICATIONS

### ABSOLUTE MAXIMUM RATINGS

SUPPLY VOLTAGE, +V <sub>S</sub> to -V <sub>S</sub>	150V
OUTPUT CURRENT, continuous within SOA	5A
POWER DISSIPATION, continuous @ T <sub>C</sub> = 25°C	85W
INPUT VOLTAGE, differential	±16 V
INPUT VOLTAGE, common mode	±V <sub>S</sub>
TEMPERATURE, pin solder – 10 sec	300°C
TEMPERATURE, junction	150°C
TEMPERATURE, storage	-65 to +150°C
TEMPERATURE RANGE, powered (case)	-55 to +125°C

### SPECIFICATIONS

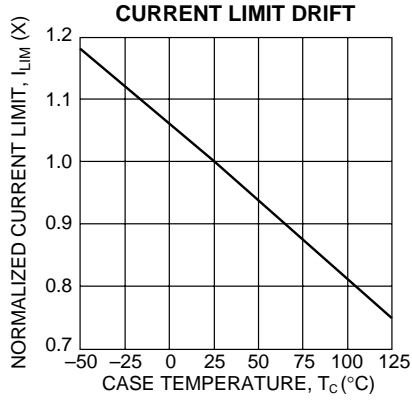

PARAMETER	TEST CONDITIONS <sup>1</sup>	MIN	TYP	MAX	UNITS
<b>INPUT</b>					
OFFSET VOLTAGE, initial	Full temperature range		5	10	mV
OFFSET VOLTAGE, vs. temperature			10	50	μV/°C
OFFSET VOLTAGE, vs supply			8	15	μV/V
OFFSET VOLTAGE, vs time				2	μV √kh
BIAS CURRENT, initial	10kHz BW, R <sub>S</sub> = 1KΩ		20	100	pA
BIAS CURRENT, vs supply				2	pA/V
OFFSET CURRENT, initial				200	pA
INPUT IMPEDANCE, DC				10 <sup>11</sup>	Ω
INPUT CAPACITANCE				5	pF
COMMON MODE, voltage range			±V <sub>S</sub> -10		V
COMMON MODE REJECTION, DC	10kHz BW, R <sub>S</sub> = 1KΩ	90	106		dB
NOISE, broad band			10		μV RMS
<b>GAIN</b>					
OPEN LOOP at 15Hz	R <sub>L</sub> = 500Ω, C <sub>C</sub> = 10pF C <sub>C</sub> = 10pF, 130V p-p, R <sub>L</sub> = 8Ω Full temp range, C <sub>C</sub> = 68pF, R <sub>L</sub> = 10Ω	94	106		dB
GAIN BANDWIDTH PRODUCT @ 1MHz			4.5		MHz
POWER BANDWIDTH			66		kHz
PHASE MARGIN			60		°
<b>OUTPUT</b>					
VOLTAGE SWING	I <sub>O</sub> = 5A	±V <sub>S</sub> -10	±V <sub>S</sub> -8		V
CURRENT, continuous		5			A
SETTLING TIME to .1%	10V step, A <sub>V</sub> = -10		2		μs
SLEW RATE	C <sub>C</sub> = 10pF, R <sub>L</sub> = 8Ω		27		V/μs
CAPACITIVE LOAD	A <sub>V</sub> = +1, C <sub>C</sub> = 68pF	10			nF
RESISTANCE, no load	R <sub>CL</sub> = 0		150		Ω
<b>POWER SUPPLY</b>					
VOLTAGE <sup>3</sup>	See Note 3	±15	±50	±75	V
CURRENT, quiescent			30	50	mA
<b>THERMAL<sup>2</sup></b>					
RESISTANCE, AC junction to case	F > 60Hz			1.3	°C/W
RESISTANCE, DC junction to case	F < 60Hz			1.5	°C/W
RESISTANCE, junction to air	Full temperature range		30		°C/W
TEMPERATURE RANGE, case	Meets full range specifications	-25		+85	°C

- NOTES: 1. Unless otherwise noted T<sub>C</sub> = 25°C, C<sub>C</sub> = 10pF, R<sub>C</sub> = 1KΩ. DC input specifications are ± value given. Power supply voltage is typical rating.
2. Long term operation at the maximum junction temperature will result in reduced product life. Derate internal power dissipation to achieve high MTTF. For guidance, refer to heatsink data sheet.
3. Derate maximum supply voltage .5 V/°C below case temperature of 25°C. No derating is needed above T<sub>C</sub> = 25°C.

### CAUTION

The PA45 is constructed from MOSFET transistors. ESD handling procedures must be observed.

The internal substrate contains beryllia (BeO). Do not break the seal. If accidentally broken, do not crush, machine, or subject to temperatures in excess of 850°C to avoid generating toxic fumes.

### GENERAL

Please read the General Operating Considerations section, which covers stability, supplies, heat-sinking, mounting, current limit, SOA interpretation, and specification interpretation. Additional information can be found in the application notes. For information on the package outline, heatsink, and mounting hardware, consult the "Accessories Information" and "Packaging" mechanical data section of the data book.

### CURRENT LIMIT

Current limiting is achieved by developing 0.83V on the amplifiers current sense circuit by way of an internal tie to the output drive (pin 8) and an external current sense line (pin 1). A sense resistor  $R_{CL}$  is used to relate this sense voltage to a current flowing from output drive.

$$R_{CL} = \frac{0.83 - 0.05 * I_{CL}}{I_{CL}}$$

$$I_{CL} = \frac{0.83}{R_{CL} + 0.05}$$

with a maximum practical value of 16Ω.  $R_{CL}$  is added to the typical value of output resistance and affects the total possible swing since it carries the load current. The swing reduction,  $V_R$  can be established  $V_R = I_{OUT} * R_{CL}$ .

### INPUT PROTECTION

The PA45 inputs are protected against common mode voltages up to the supply rails, differential voltages up to ±16 volts and static discharge. Differential voltages exceeding 16 volts will be clipped by the protection circuitry. However, if more than a few milliamps of current is available from the input drive source, the protection circuitry could be destroyed. The protection circuitry includes 300 ohm current limiting resistors at each input. This security may be insufficient for severe overdrive of the input. Adding external resistors to the application which limits severe input overdrive current to 1mA, will prevent damage.

### STABILITY

The PA45 has sufficient phase margin when compensated for unity gain to be stable with capacitive loads of at least 10nF. However, the low pass circuit created by the sum-point (-in) capacitance and the feedback network may add phase shift and cause instabilities. As a rule, the sum-point load resistance (input and feedback resistors in parallel) should be 1k ohm or less. Alternatively, use a bypass capacitor across the feedback resistor. The time constant of the feedback resistor and bypass capacitor combination should match the time constant of the sum-point resistance and sum-point capacitance.

The PA45 is externally compensated and performance can be tailored to the application. The compensation network  $C_C$ - $R_C$  must be mounted closely to the amplifier pins 7 and 2 to avoid noise coupling to these high impedance nodes.

### SAFE OPERATING AREA (SOA)

The MOSFET output stage of this power operational amplifier has limitations from its channel temperature.

NOTE: The output is protected against transient flyback. However, for protection against sustained, high energy flyback, external fast-recovery diodes should be used.
