Description

Pericom Semiconductor's PI2LVD412 is an 8-to-4 differential channel multiplexer/demultiplexer switch. The device is bidirectional and designed specifically for Low Voltage Differential Signals. Users can take advantage of low bit-to-bit skew and high channel-to-channel noise isolation.

Application

Routes multiple Low Voltage Differential Signals at high-speed data rates with little or no attenuation.

Note:

Stresses greater than those listed under MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.

Test Circuit for Electrical Characteristics

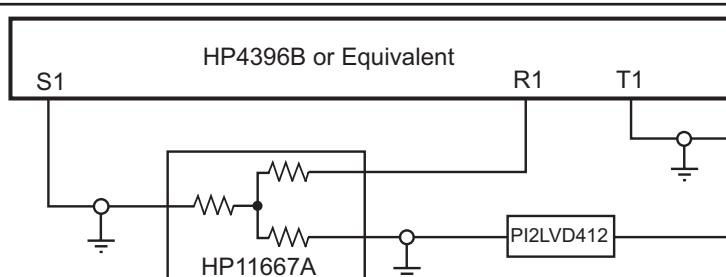

Notes:

- C_L = Load capacitance: includes jig and probe capacitance.
- R_T = Termination resistance: should be equal to Z_{OUT} of the Pulse Generator.
- Waveform 1 is for an output with internal conditions such that the output is low except when disabled by the output control. Waveform 2 is for an output with internal conditions such that the output is high except when disabled by the output control.
- All input impulses are supplied by generators having the following characteristics: PRR \leq MHz, $Z_O = 50\Omega$, $t_R \leq 2.5\text{ns}$, $t_F \leq 2.5\text{ns}$.
- The outputs are measured one at a time with one transition per measurement.
