## Product Description:

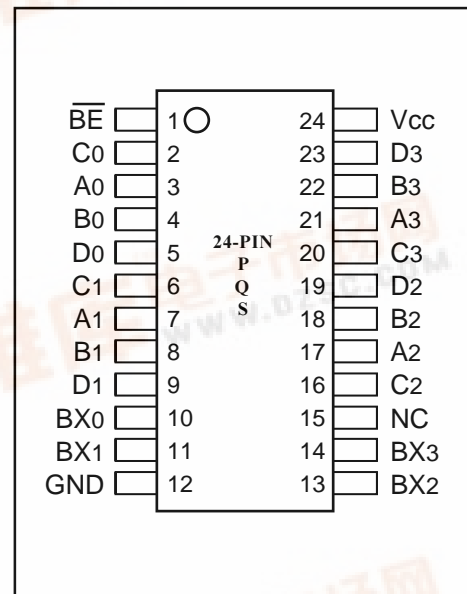

Pericom Semiconductor's PI5C series of logic circuits are produced in the Company's advanced 0.8 micron CMOS technology, achieving industry leading speed grades.

The PI5C3400 is a 4-bit, 4-port bus switch with individual exchanges designed with a low ON resistance (5Ω) allowing inputs to be connected directly to outputs. The bus switch creates no additional propagational delay or ground bounce noise. The switches are turned ON by the Bus Enable ( $\overline{\text{BE}}$ ) input signal, and the Bus Exchange (BX0–BX3) input signals offer individual bit swapping of the AB and CD signal pairs. This exchange configuration allows bit swapping of buses in systems.

### Notes:

1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device type.
2. Typical values are at  $V_{CC} = 5.0\text{V}$ ,  $T_A = 25^\circ\text{C}$  ambient and maximum loading.
3. Not more than one output should be shorted at one time. Duration of the test should not exceed one second.
4. Measured by the voltage drop between A and B pin at indicated current through the switch. ON resistance is determined by the lower of the voltages on the two (A,B) pins.
5. This parameter is determined by device characterization but is not production tested.

## Power Supply Characteristics

Parameters	Description	Test Conditions <sup>(1)</sup>		Min.	Typ <sup>(2)</sup>	Max.	Units

### Notes:

1. For Max. or Min. conditions, use appropriate value specified under Electrical Characteristics for the applicable device.
2. Typical values are at V<sub>CC</sub> = 5.0V, +25°C ambient.
3. Per TTL driven input (V<sub>IN</sub> = 3.4V, control inputs only); A and B pins do not contribute to I<sub>cc</sub>.
4. This current applies to the control inputs only and represent the current required to switch internal capacitance at the specified frequency. The A and B inputs generate no significant AC or DC currents as they transition. This parameter is not tested, but is guaranteed by design.

## Switching Characteristics over Operating Range

Parameters	Description	Conditions <sup>(1)</sup>	PI5C3400		Unit
			Com.		
			Min.	Max.	
tPLH tPHL	Propagation Delay <sup>(2,3)</sup> Ax to Cx, Bx to Dx	CL = 50 pF RL = 500Ω		0.25	ns
tPZH tPZL	Bus Enable Time BE to Cx or Dx		1.5	6.5	ns
tPHZ tPLZ	Bus Disable Time BE to Cx or Dx		1.5	5.5	ns
tbX	Bus Exchange Time BXx to Cx or Dx		1.5	6.5	ns

### Notes:

1. See test circuit and waveforms.
2. This parameter is guaranteed but not tested on Propagation Delays.
3. The bus switch contributes no propagational delay other than the RC delay of the ON resistance of the switch and the load capacitance. The time constant for the switch alone is of the order of 0.25 ns for 50 pF load. Since this time constant is much smaller than the rise/fall times of typical driving signals, it adds very little propagational delay to the system. Propagational delay of the bus switch when used in a system is determined by the driving circuit on the driving side of the switch and its interaction with the load on the driven side.
