## Pm37LV512

### 512 Kbit (64K X 8) Dual-Voltage Multiple-Cycle-Programmable ROM

#### FEATURES

- **Low Voltage Operation**
  - Dual read  $V_{CC}$  ranges: 2.7 V to 3.6 V or 4.5 V to 5.5 V
  - Program/Erase voltage:  $V_{CC}$  - 2.7 V to 3.6 V and  $V_{PP}$  - 11.5 V to 12.5 V
- **High Performance Read**
  - 70 ns access time
- **Electrical Chip Erase and Byte Program Using EPROM Programmer**
  - Maximum 20  $\mu$ s/byte programming
  - Maximum 100 ms chip erase
  - Do not require UV erase
- **Low Power Consumption**
  - Typical 5 mA active read current
  - Typical 18  $\mu$ A CMOS standby current
- **Excellent Product Reliability**
  - Guarantee minimum 1,000 program/erase cycles
  - Minimum 20 years data retention
- **JEDEC Standard Byte-wide Flash Memory Pin-out**
- **Industrial Standard Packaging**
  - 32-pin PLCC
  - 32-pin PDIP
  - 32-pin VSOP

#### GENERAL DESCRIPTION

The Pm37LV512 is a 512 Kbit, Multiple-Cycle-Programmable Read-Only-Memory (MCP ROM) organized as 65,563 bytes of 8 bits each. The program and erase operation of device can be done on EPROM programmers by applying 3.0 Volt  $V_{CC}$  and 12.0 Volt  $V_{PP}$  to A9 and/or OE# pin. This eliminates the need of a UV-Source for erase operation such as EPROM device. The read operation of device can be in 2.7 Volt to 3.6 Volt or 4.5 Volt - 5.5 Volt range compatible to either 3.0 Volt or 5.0 Volt systems. The dual read operation ranges can greatly increase application flexibility for users.

The device has a standard microprocessor interface as well as JEDEC single-power-supply Flash compatible pin-out. For applications that do not require in-system-programming (ISP) function for firmware upgrade, the Pm37LV512 offers a direct cost reduction path for Flash memory, i.e. Pm39LV512, without modifying the schematic and board layout of system.

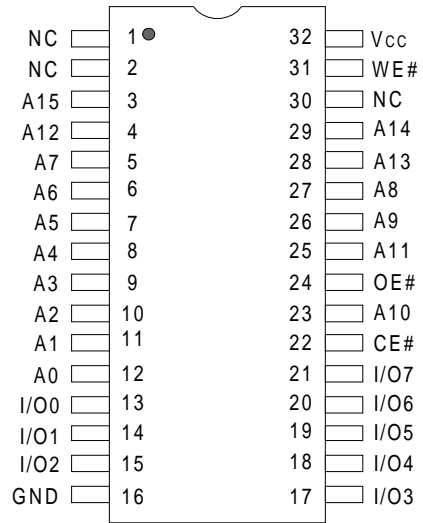

The Pm37LV512 is manufactured on PMC's advanced nonvolatile CMOS technology, P-FLASH™. The device is offered in 32-pin PLCC, VSOP and PDIP packages with access time of 70 ns.

**LOGIC SYMBOL**

**PRODUCT ORDERING INFORMATION**

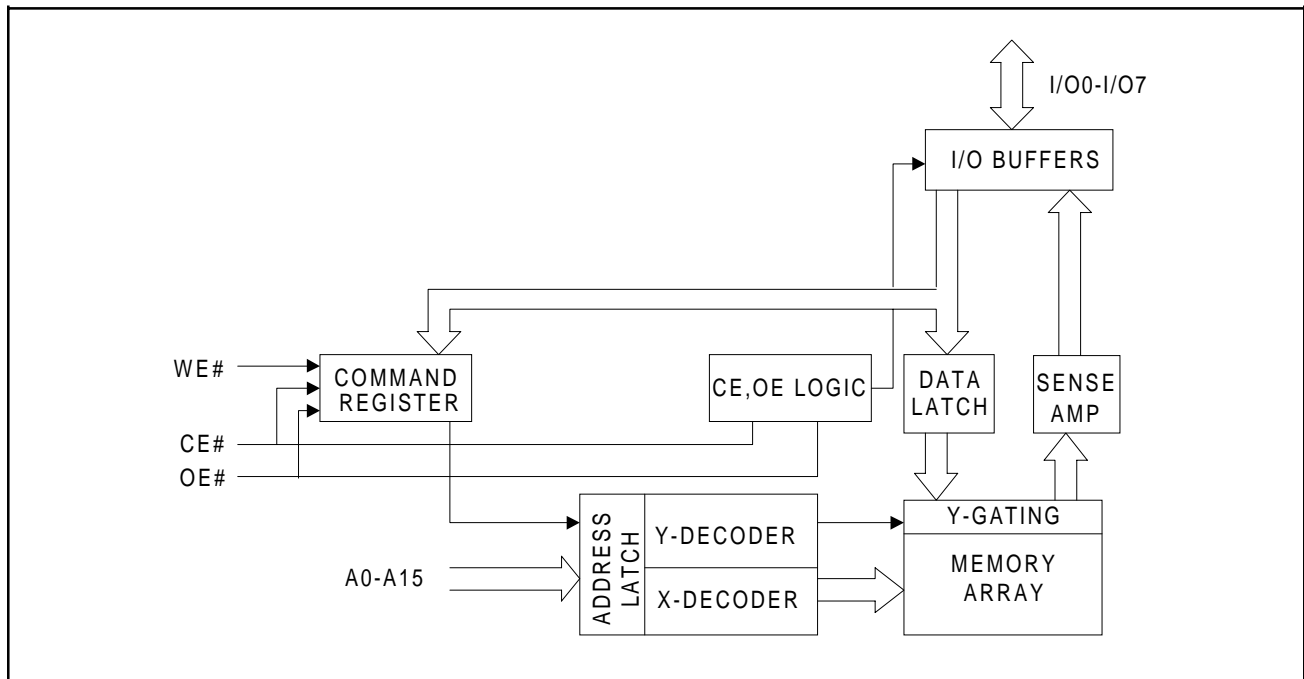

Part Number	t <sub>ACC</sub> (ns)	Package	Temperature Range
Pm37LV512-70JC	70	32J	Commercial (0°C to + 70°C)
Pm37LV512-70PC		32P	Commercial (0°C to + 70°C)
Pm37LV512-70VC		32V	Commercial (0°C to + 70°C)

**PIN DESCRIPTIONS**

<b>SYMBOL</b>	<b>TYPE</b>	<b>DESCRIPTION</b>
A0 - A15	INPUT	Address Inputs: For memory addresses input. Addresses are internally latched on the falling edge of WE# during a write cycle.
CE#	INPUT	Chip Enable: CE# goes low activates the device's internal circuitries for device operation. CE# goes high deselects the device and switches into standby mode to reduce the power consumption.
WE#	INPUT	Write Enable: Activate the device for write operation. WE# is active low.
OE#	INPUT	Output Enable: Control the device's output buffers during a read cycle. OE# is active low.
I/O0 - I/O7	INPUT/ OUTPUT	Data Inputs/Outputs: Input command/data during a write cycle or output data during a read cycle. The I/O pins float to tri-state when OE# are disabled.
V <sub>CC</sub>		Device Power Supply
GND		Ground
NC		No Connection

## BLOCK DIAGRAM

## DEVICE OPERATION

### READ OPERATION

The access of Pm37LV512 is similar as that of EPROM or Flash Memory. To obtain data at the outputs, three control functions must be satisfied:

- CE# is the chip enable and should be pulled low ( $V_{IL}$ ).
- OE# is the output enable and should be pulled low ( $V_{IL}$ ).
- WE# is the write enable and should remain high ( $V_{IH}$ ).

### BYTE PROGRAMMING

The Pm37LV512 is programmed by using an external EPROM programmer. The programming mode is activated by applying 12.0 Volt on OE# pin and  $V_{IL}$  on CE# pin. The byte program operation is completed by asserting WE# to low for 20  $\mu$ s. A chip erase operation is required prior to program due to a data "0" can not be programmed back to a "1" and only erase operation can convert "0"s to "1"s. The entire chip can be programmed byte-by-byte by using the byte program algorithm. Refer to Chart 1. Byte Programming Flowchart and Byte Program Operations AC Waveforms.

### CHIP ERASE

The entire memory array can be erased through a chip erase operation on an external EPROM programmer. Pre-program the "1"s cells in the device is not required prior to chip erase operation. The chip erase operation is activated by applying 12.0 Volt to OE# and A9 pins while CE# pin is low. All other address and data pins are "don't care". Chip erase is completed by asserting WE# pin to low for 100 ms. The falling edge of WE# will start the chip erase operation. The device will return back to standby mode after the completion of chip erase. Refer to Chart 2. Chip Erase Flowchart and Chip Erase Operations AC Waveforms.

### PRODUCT IDENTIFICATION

The hardware product identification mode can be used by an EPROM programmer to identify the device and manufacturer for selecting the right programming algorithm for the device. The product identification mode is activated by applying 12.0 Volt on A9 pin. For details, please see Bus Operation Modes in Table 1.

**OPERATING MODES**

**Table 1. Bus Operation Modes**

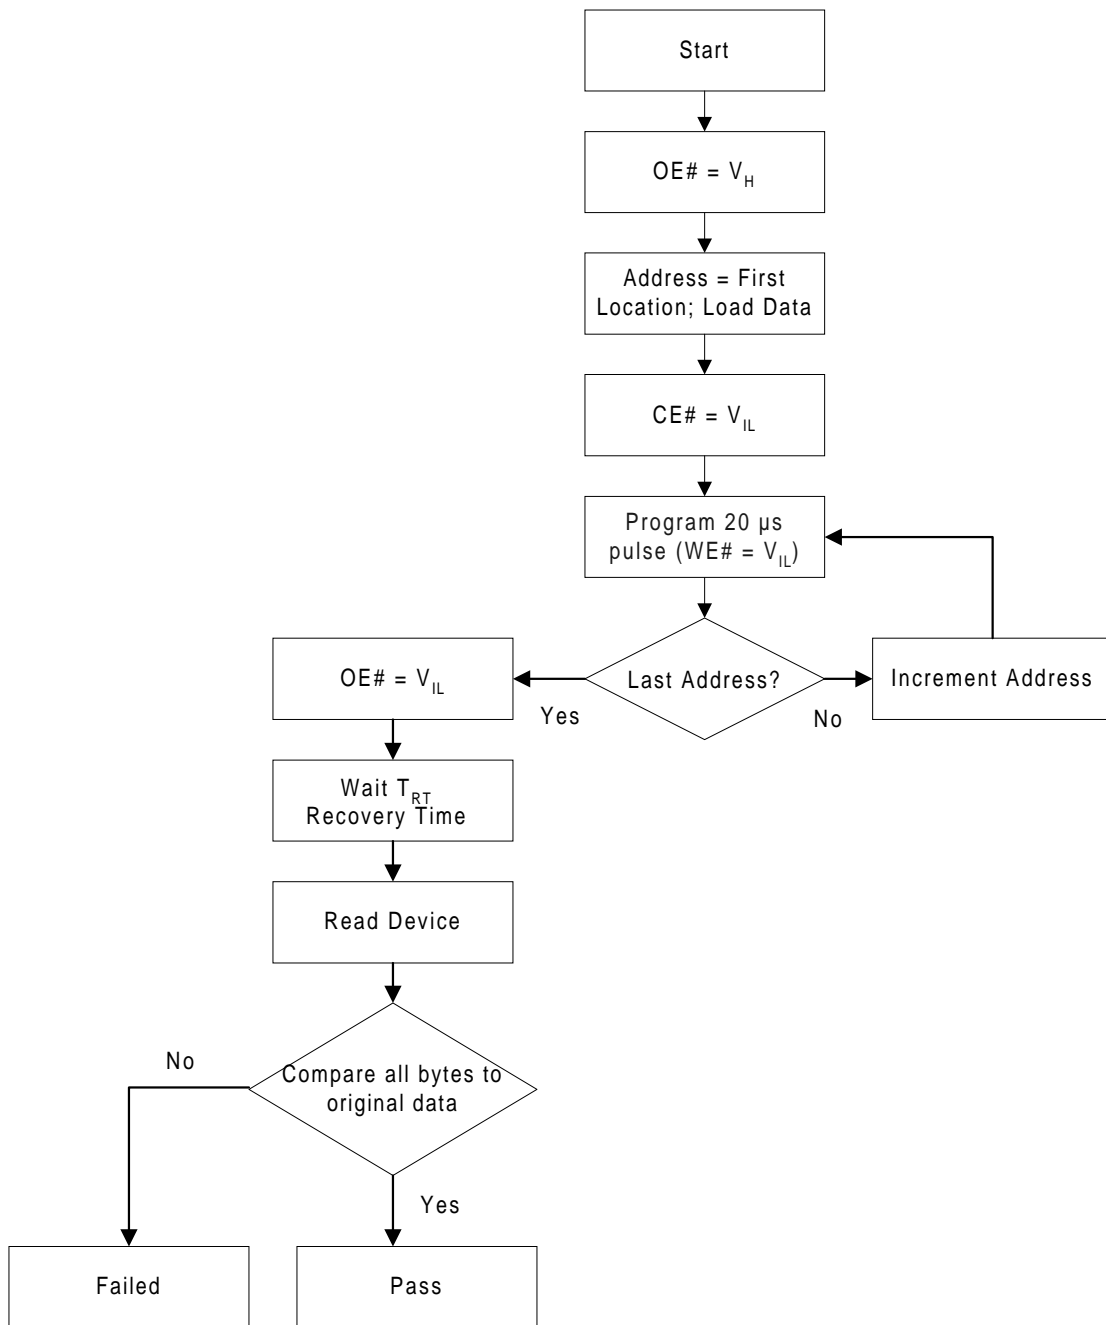

Mode	CE#	OE#	WE#	A <sub>9</sub>	ADDRESS	I/O
Read	V <sub>IL</sub>	V <sub>IL</sub>	V <sub>IH</sub>	A <sub>N</sub>	A <sub>N</sub>	D <sub>OUT</sub>
Chip-Erase	V <sub>IL</sub>	V <sub>H</sub> <sup>(1)</sup>	V <sub>IL</sub>	V <sub>H</sub>	X <sup>(2)</sup>	High Z
Byte-Program	V <sub>IL</sub>	V <sub>H</sub>	V <sub>IL</sub>	A <sub>N</sub>	A <sub>N</sub>	D <sub>IN</sub>
Program/Erase Inhibit	X	X	V <sub>IH</sub>	X	X	High Z
	X	V <sub>IL</sub> or V <sub>IH</sub>	X	X	X	High Z/ D <sub>OUT</sub>
Standby	V <sub>IH</sub>	X	X	X	X	High Z
Output Disable	X	V <sub>IH</sub>	X	X	X	High Z
Product Identification Hardware	V <sub>IL</sub>	V <sub>IL</sub>	V <sub>IH</sub>	V <sub>H</sub>	A2 - A15 = X, A1 = V <sub>IL</sub> , A0 = V <sub>IL</sub>	Manufacturer Code <sup>(3)</sup>
					A2 - A15 = X, A1 = V <sub>IL</sub> , A0 = V <sub>IH</sub>	Device Code <sup>(3)</sup>

Notes:

1. V<sub>H</sub> = 12.0 V ± 0.5 V.
2. X can be V<sub>IL</sub>, V<sub>IH</sub> or addresses.
3. Manufacturer Code: 9Dh;  
Device Code: 9Bh

**ABSOLUTE MAXIMUM RATINGS <sup>(1)</sup>**

Temperature Under Bias	-65°C to +125°C
Storage Temperature	-65°C to +125°C
Surface Mount Lead Soldering Temperature	240°C 3 Seconds
Input Voltage with Respect to Ground on All Pins except OE# and A9 pin <sup>(2)</sup>	-0.5 V to $V_{CC} + 0.5$ V
Input Voltage with Respect to Ground on OE# and A9 pin <sup>(3)</sup>	-0.5 V to +13.0 V
All Output Voltage with Respect to Ground	-0.5 V to $V_{CC} + 0.5$ V
$V_{CC}$ <sup>(2)</sup>	-0.5 V to +6.0 V

Notes:

1. Stresses under those listed in “Absolute Maximum Ratings” may cause permanent damage to the device. This is a stress rating only. The functional operation of the device or any other conditions under those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating condition for extended periods may affected device reliability.
2. Maximum DC voltage on input or I/O pins are  $V_{CC} + 0.5$  V. During voltage transitioning period, input or I/O pins may overshoot to  $V_{CC} + 2.0$  V for a period of time up to 20 ns. Minimum DC voltage on input or I/O pins are -0.5 V. During voltage transitioning period, input or I/O pins may undershoot GND to -2.0 V for a period of time up to 20 ns.
3. Maximum DC voltage on OE# and A9 pin is +13.0 V. During voltage transitioning period, OE# and A9 pin may overshoot to +14.0 V for a period of time up to 20 ns. Minimum DC voltage on OE# and A9 pin is -0.5 V. During voltage transitioning period, OE# and A9 pin may undershoot GND to -2.0 V for a period of time up to 20 ns.

**DC AND AC OPERATING RANGE**

<b>Part Number</b>		<b>Pm37LV512</b>
Operating Temperature		0°C to 70°C
Program/Erase	$V_{CC}$	2.7 V - 3.6 V
	$V_{PP}$	11.5 V - 12.5 V
Read	$V_{CC}$	2.7 V - 3.6 V or 4.5 V - 5.5 V

**DC CHARACTERISTICS**

Symbol	Parameter	Condition	Min	Typ	Max	Units
$I_{LI}$	Input Load Current	$V_{IN} = 0\text{ V to }V_{CC}$			1	$\mu\text{A}$
$I_{LO}$	Output Leakage Current	$V_{IO} = 0\text{ V to }V_{CC}$			1	$\mu\text{A}$
$I_{SB1}$	$V_{CC}$ Standby Current CMOS	$CE\#, OE\# = V_{CC} \pm 0.3\text{ V}$		18	100	$\mu\text{A}$
$I_{SB2}$	$V_{CC}$ Standby Current TTL	$CE\# = V_{IH}\text{ to }V_{CC}$		0.01	3	mA
$I_{CC1}$	$V_{CC}$ Active Read Current	$f = 5\text{ MHz}; I_{OUT} = 0\text{ mA}$		5	15	mA
$V_{IL}$	Input Low Voltage		-0.5		0.8	V
$V_{IH}$	Input High Voltage		$0.7 V_{CC}$		$V_{CC} + 0.3$	V
$V_{OL}$	Output Low Voltage	$I_{OL} = 2.1\text{ mA}; V_{CC} = V_{CC}\text{ min}$			0.45	V
$V_{OH}$	Output High Voltage	$I_{OH} = -100\ \mu\text{A}; V_{CC} = V_{CC}\text{ min}$	$V_{CC} - 0.2$			V

**REVISION HISTORY**

<b>Date</b>	<b>Revision No.</b>	<b>Description of Changes</b>	<b>Page No.</b>
March, 2002	1.0	New publication	All
May, 2002	1.1	Revised features and general description	1
		Removed 90 ns speed grade	3, 10, 12
		Revised bus operation modes	6
		Revised absolute maximum ratings	9
		Revised $I_{SB1}$ specification	10
		Revised program/erase operation characteristics and waveforms	12, 13
June, 2002	1.2	Corrected the typo in 32-Pin PDIP pin connection	2
		Corrected the typo of $T_{RT}$ recovery time in Byte Programming Flowchart	7
Dec. 2002	1.3	Added 32-Pin VSOP package spec.	1, 2, 3, 16
