## PS21352-N

### INTEGRATED POWER FUNCTIONS

600V/5A low-loss 4th generation (planar) IGBT inverter bridge for 3 phase DC-to-AC power conversion.

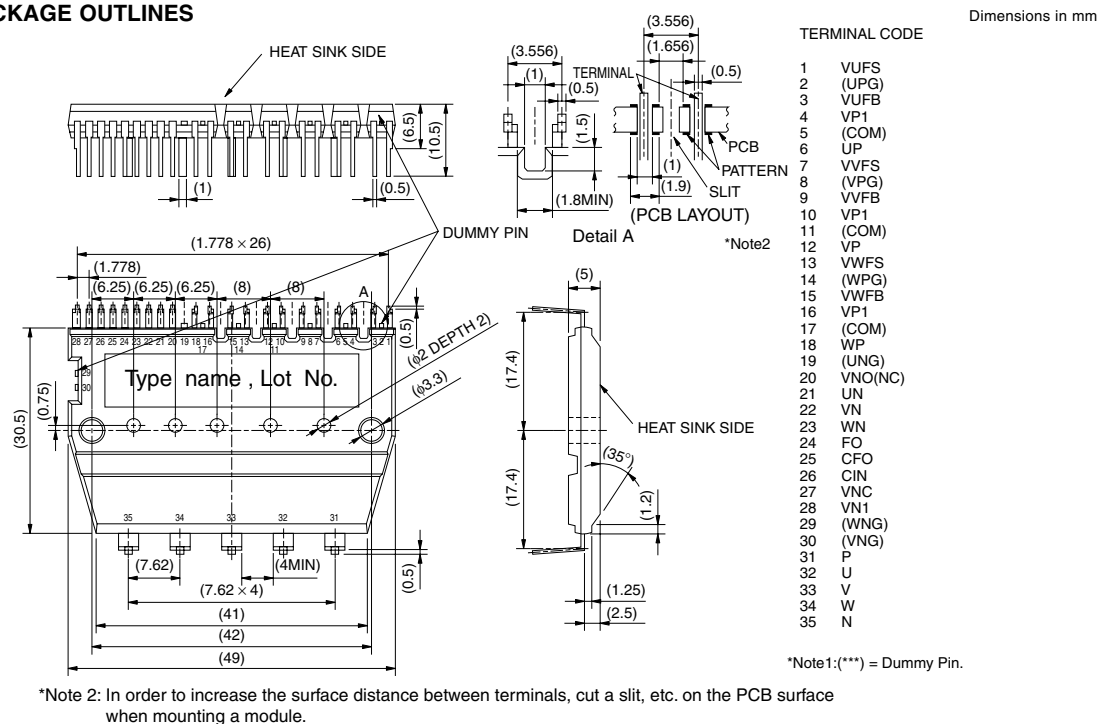

### INTEGRATED DRIVE, PROTECTION AND SYSTEM CONTROL FUNCTIONS

- For upper-leg IGBTs : Drive circuit, High voltage isolated high-speed level shifting, Control circuit under-voltage (UV) protection.  
Note : Bootstrap supply scheme can be applied.
- For lower-leg IGBTs : Drive circuit, Control circuit under-voltage protection (UV), Short-circuit protection (SC).
- Fault signaling : Corresponding to a SC fault (Low-side IGBT) or a UV fault (Low-side IGBT).
- Input interface : 5V line CMOS/TTL compatible, Schmitt Trigger receiver circuit.

## APPLICATION

AC100V~200V inverter drive for motor control.

**Fig. 2 INTERNAL FUNCTIONS BLOCK DIAGRAM (TYPICAL APPLICATION EXAMPLE)**

**Fig. 3 EXTERNAL PART OF THE DIP-IPM PROTECTION CIRCUIT**

Note1: In the recommended external protection circuit, please select the RC time constant in the range 1.5~2.0μs.  
2: To prevent erroneous protection operation, the wiring of A, B, C should be as short as possible.

Short Circuit Protective Function (SC) :  
SC protection is achieved by sensing the L-side DC-Bus current (through the external shunt resistor) after allowing a suitable filtering time (defined by the RC circuit). When the sensed shunt voltage exceeds the SC trip-level, all the L-side IGBTs are turned OFF and a fault signal (Fo) is output. Since the SC fault may be repetitive, it is recommended to stop the system when the Fo signal is received and check the fault.

**Note :** RC coupling at each input (parts shown dotted) may change depending on the PWM control scheme used in the application and on the wiring impedance of the application's printed circuit board.

TRANSFER-MOLD TYPE  
INSULATED TYPE

Fig. 7 TYPICAL DIP-IPM APPLICATION CIRCUIT EXAMPLE

**Note 1 :** To prevent the input signals oscillation, an RC coupling at each input is recommended, and the wiring of each input should be as short as possible (less than 2cm).

**2 :** By virtue of integrating an application specific type HVIC inside the module, direct coupling to CPU terminals without any opto-coupler or transformer isolation is possible.

**3 :** Fo output is open collector type. This signal line should be pulled up to the positive side of the 5V power supply with approximately 5.1k $\Omega$  resistance.

**4 :** Fo output pulse width should be decided by connecting an external capacitor between CFO and VNC terminals (CFO). (Example : CFO = 22 nF  $\rightarrow$  tFO = 1.8 ms (typ.))

**5 :** Each input signal line should be pulled up to the positive side of the 5V power supply with approximately 4.7k $\Omega$  resistance (other RC coupling circuits at each input may be needed depending on the PWM control scheme used and on the wiring impedances of the system's printed circuit board). Approximately a 0.22~2 $\mu$ F by-pass capacitor should be used across each power supply connection terminals.

**6 :** To prevent errors of the protection function, the wiring of A, B, C should be as short as possible.

**7 :** In the recommended protection circuit, please select the R1C5 time constant in the range of 1.5~2 $\mu$ s.

**8 :** Each capacitor should be put as nearby the terminals of the DIP-IPM as possible.

**9 :** To prevent surge destruction, the wiring between the smoothing capacitor and the P&N1 terminals should be as short as possible. Approximately a 0.1~0.22 $\mu$ F snubber capacitor between the P&N1 terminals is recommended.
