

MCM67Q909

Advance Information

**512K x 9 Bit Separate I/O
Synchronous Fast Static RAM**

The MCM67Q909 is a 4M-bit static random access memory, organized as 512K words of 9 bits. It features separate TTL input and output buffers, which drive 3.3 V output levels, and incorporates input and output registers on-board with high speed SRAM. It also features transparent-write and data pass-through capabilities.

The synchronous design allows for precise cycle control with the use of an external single clock (K). The addresses (A0 – A18), data input (D0 – D8), data output (Q0 – Q8), write-enable (W), chip-enable (E), and output-enable (G), are registered on the rising edge of clock (K).

The control pins (E, W, G) function differently in comparison to most synchronous SRAMs. This device will not deselect with E high. The RAM remains active at all times. If E is registered high, the output pins (Q0 – Q8) will be driven if G is registered low. The transparent write feature allows the output data to track the input data. E, G, and W must be asserted to perform a transparent write (write and pass-through). The input data is available at the outputs on the next rising edge of clock (K).

The pass-through function is always enabled. E high disables the write to the array while allowing a pass-through cycle to occur on the next rising edge of clock (K). Only a registered G high will three-state the outputs.

The MCM67Q909 is available in an 86-bump surface mount PBGA (Plastic Ball Grid Array) package.

- Single 5 V ± 5% Power Supply
- Fast Cycle Time: 12 ns Max
- Single Clock Operation
- TTL Input and Output Levels (Outputs LVTTTL Compatible)
- Address, Data Input, E, W, and G Registers On-Chip
- 83 MHz Maximum Clock Cycle Time
- Self-Timed Write
- Separate Data Input and Output Pins
- Transparent-Write and Pass-Through
- High Output Drive Capability: 50 pF/Output at Rated Access Time
- Boundary Scan Implementation
- PBGA Package for High Speed Operation

**86 BUMP PBGA

BLOCK DIAGRAM

NOTES:

1. Bypass mode is entered with SE low and SCK cycled.
2. SH BSR = shadow bypass scan register.
3. 41 bumps used in boundary scan. V_{SS}, V_{CC}, NC, SDI, SDO, SE, and SCK not used in scan path.
4. SDO output sequence: A6, A4, A2, A0, D8, Q8, D6, Q6, D4, Q4, D2, Q2, D0, Q0, A18, A1, A3, A5, A7, A8, A9, A10, A11, A12, A13, Q1, D1, Q3, D3, Q5, D5, Q7, D7, A15, A16, A14, A17, E, G, W, K.

* Four added test pins.

TRUTH TABLE

E (t_n)	W (t_n)	G (t_{n+1})	Mode	D0 – D8 (t_n)	Q0 – Q8 (t_{n+1})	V _{CC} Current
L	L	L	Write and Pass-Through	Valid	D0 – D8 (t_n)	I _{CC}
		H	Write	Valid	High-Z	I _{CC}
H	L	L	Pass-Through	Valid	D0 – D8 (t_n)	I _{CC}
		H	Pass-Through	Don't Care	High-Z	I _{CC}

		H	Read	Don't Care	High-Z	I _{CC}

ABSOLUTE MAXIMUM RATINGS (See Note)

Rating	Symbol	Value	Unit
Power Supply Voltage	V _{CC}	- 0.5 to + 7.0	V
Voltage Relative to V _{SS} for Any Pin Except V _{CC}	V _{in} , V _{out}	- 0.5 to V _{CC} + 0.5	V
Output Current	I _{out}	± 30	mA
Power Dissipation	P _D	1.7	W
Temperature Under Bias	T _{bias}	- 10 to + 85	°C
Operating Temperature	T _A	0 to + 70	°C
Storage Temperature — Plastic	T _{stg}	- 55 to + 125	°C

NOTE: Permanent device damage may occur if ABSOLUTE MAXIMUM RATINGS are exceeded. Functional operation should be restricted to RECOMMENDED OPERATING CONDITIONS. Exposure to higher than recommended voltages for extended periods of time could affect device reliability.

This is a synchronous device. All synchronous inputs must meet specified setup and hold times with stable logic levels for **ALL** rising edges of clock (K) while the device is selected.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions be taken to avoid application of any voltage higher than maximum rated voltages to these high-impedance circuits.

DC OPERATING CONDITIONS AND CHARACTERISTICS

(V_{CC} = 5.0 V ± 5%, T_A = 0 to + 70°C, Unless Otherwise Noted)

RECOMMENDED OPERATING CONDITIONS AND SUPPLY CURRENTS

Parameter	Symbol	Min	Max	Unit
Supply Voltage (Operating Voltage Range)	V _{CC}	4.75	5.25	V
Input High Voltage	V _{IH}	2.2	V _{CC} + 0.3**	V
Input Low Voltage	V _{IL}	- 0.5*	0.8	V
Input Leakage Current (All Inputs, V _{in} = 0 to V _{CC})	I _{lkg(I)}	—	± 1.0	µA
Output Leakage Current (E = V _{IH} , V _{out} = 0 to V _{CC})	I _{lkg(O)}	—	± 1.0	µA
AC Supply Current (I _{out} = 0 mA) (V _{CC} = max, f = f _{max}) MCM67Q909–12 ns	I _{CCA}	—	230	mA
Output Low Voltage (I _{OL} = + 8.0 mA)	V _{OL}	—	0.4	V
Output High Voltage (I _{OH} = - 4.0 mA)	V _{OH}	2.4	3.3	V

* V_{IL} (min) = - 0.5 V dc; V_{IL} (min) = - 2.0 V ac (pulse width ≤ 20 ns) for I ≤ 20.0 mA.

** V_{IH} (max) = V_{CC} + 0.3 V dc; V_{IH} (max) = V_{CC} + 2.0 V ac (pulse width ≤ 20 ns) for I ≤ 20.0 mA.

CAPACITANCE (f = 1.0 MHz, dV = 3.0 V, T_A = 25°C, Periodically Sampled Rather Than 100% Tested)

Parameter	Symbol	Max	Unit
Address and Data Input Capacitance	C _{in}	6	pF
Control Pin Input Capacitance	C _{in}	6	pF
Output Capacitance	C _{out}	8	pF

AC OPERATING CONDITIONS AND CHARACTERISTICS

(V_{CC} = 5.0 V ± 5%, T_A = 0 to + 70°C, Unless Otherwise Noted)

Input Timing Measurement Reference Level	1.5 V	Output Timing Reference Level	1.5 V

SCK High to SDI Don't Care	t_{CHIX}	10	—	ns	
SCK Low to SDO Valid	t_{CLOV}	—	20	ns	

NOTES:

1. The minimum delay required between ending normal operation and beginning scan operations.
2. The minimum delay required between ending shift mode and beginning bypass mode.
3. The minimum delay required before restarting normal RAM operation.
4. The minimum delay required before executing a parallel load operation.
5. The minimum delay required between a parallel load operation and a shift.
6. Minimum shift command hold time.

BOUNDARY SCAN

OVERVIEW

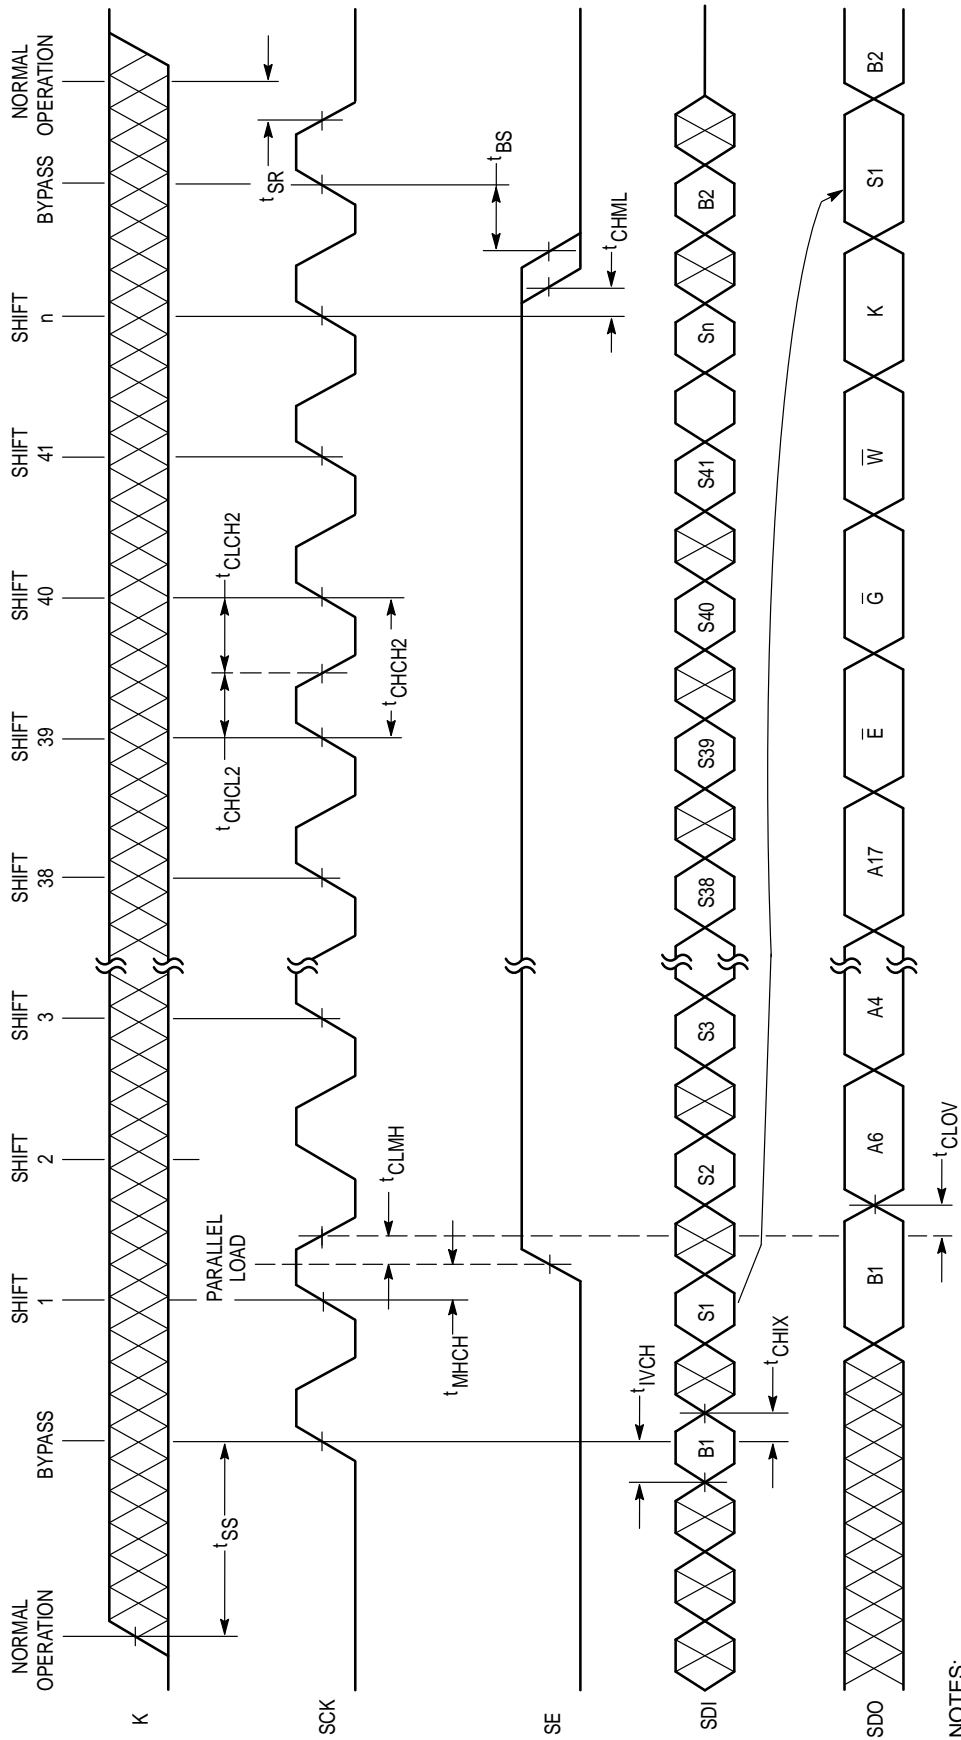

Boundary scan is a simple, non-intrusive scheme that allows verification of electrical continuity for each of a clocked RAMs logically active inputs and I/Os without adversely affecting RAM performance. Boundary scan allows the user to monitor the logic levels applied to each signal I/O on the RAM, and to shift them out in a serial bit stream.

OPERATION

Boundary scan requires four signal pins for implementation: scan data in (SDI), scan data out (SDO), scan clock (SCK, active high), and scan enable (SE, active high).

Boundary scan provides three modes of operation: (1) normal RAM operation, (2) scan, and (3) bypass. For normal RAM operation, SCK and SE must be held low. The RAM will always return to normal operation immediately after the RAM receives a rising edge of the RAM input clock (K) with SCK and SE held low. To enter scan mode, SCK is activated. The first rising edge of SCK is used to latch in the data on the scan registers. SE is then driven high to disable additional input data from entering the scan registers. Every falling edge of SCK serially shifts data through the scan registers and onto the SDO pin. To enter bypass mode, simply exercise SCK with SE held low. In this mode, SDI is sampled on the rising edge of SCK. The level found on SDI is then driven out on SDO on the next falling edge of SCK.

BOUNDARY SCAN TIMING DIAGRAM

NOTES:

- B1 and B2 = bypass serial data from outside source.
- S1 - Sn + 1 = serial scan data from outside source.
- S1 - Sn = RAMs input register contents.
- Scan order is: A6, A4, A2, A0, D8, Q8, D6, Q6, D4, Q4, D2, Q2, D0, Q0, A18, A1, A3, A5, A7, A8, A9, A10, A11, A12, A13, Q1, D1, Q3, D3, Q5, D5, Q7, D7, A15, A16, A14, A17, \bar{E} , \bar{G} , \bar{W} , K.
