Description

The RIC7113A4 is a high voltage, high speed power MOSFET and IGBT driver with independent high and low side referenced output channels. Proprietary HVIC and latch immune CMOS technologies enable ruggedized monolithic construction. Logic inputs are compatible with standard CMOS or LSTTL outputs. The output drivers feature a high pulse current buffer stage designed for minimum driver cross-conduction. Propagation delays are matched to simplify use in high frequency applications. The floating channel can be used to drive an N-channel power MOSFET or IGBT in the high side configuration which operates up to 400 volts.

Radiation Performance

International Rectifier Radiation Hardened gate drivers are tested to verify their hardness capability. The hardness assurance program at International rectifier uses a Cobalt-60 (^{60}Co) source and heavy ion irradiation.

Every wafer shall be tested per MIL-STD-883, Method 1019, test condition A "Ionizing Radiation (Total Dose) Test Procedure".

Both pre- and post- irradiation performances are tested and specified using the same drive circuitry and test conditions to provide a direct comparison.

For Static Irradiation Test Conditions refer to figure 7.
