

New product

16-BIT CMOS MICROCOMPUTER

**DESCRIPTION**

The M37733S4LHP is a microcomputer using the 7700 Family core. This microcomputer has a CPU and a bus interface unit. The CPU is a 16-bit parallel processor that can be an 8-bit parallel processor, and the bus interface unit enhances the memory access efficiency to execute instructions fast. This microcomputer also includes a 32 kHz oscillation circuit, in addition to the RAM, multiple-function timers, serial I/O, A-D converter, and so on.

Its strong points are the low power dissipation, the low supply voltage and the small package.

**FEATURES**

- Number of basic instructions ..... 103
- Memory size RAM ..... 2048 bytes
- Instruction execution time  
The fastest instruction at 12 MHz frequency ..... 333 ns
- Single power supply ..... 2.7–5.5 V
- Low power dissipation (At 3 V supply voltage, 12 MHz frequency)  
..... 10.8 mW (Typ.)
- Interrupts ..... 19 types, 7 levels
- Multiple-function 16-bit timer ..... 5 + 3

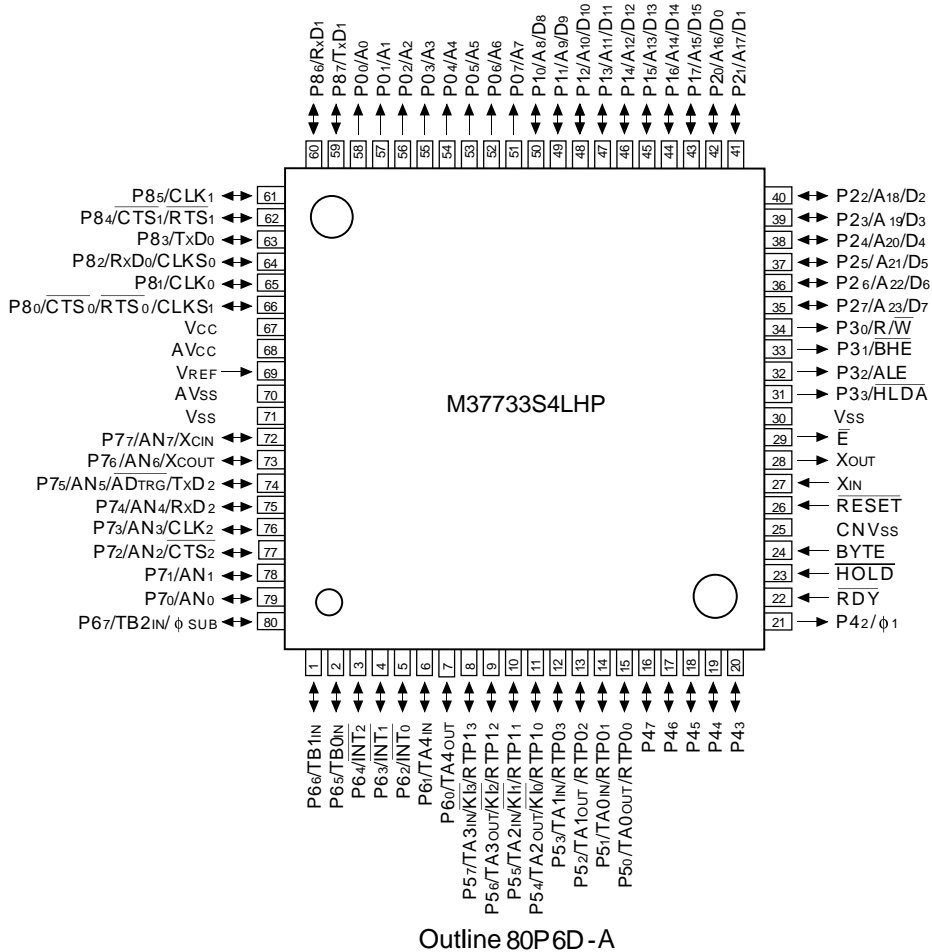

- Serial I/O (UART or clock synchronous)..... 3
- 10-bit A-D converter ..... 8-channel inputs
- 12-bit watchdog timer
- Programmable input/output  
(ports P4, P5, P6, P7, P8) ..... 37
- Clock generating circuit ..... 2 circuits built-in
- Small package ..... 80-pin plastic molded fine-pitch QFP  
(80P6D-A;0.5 mm lead pitch)

**APPLICATION**

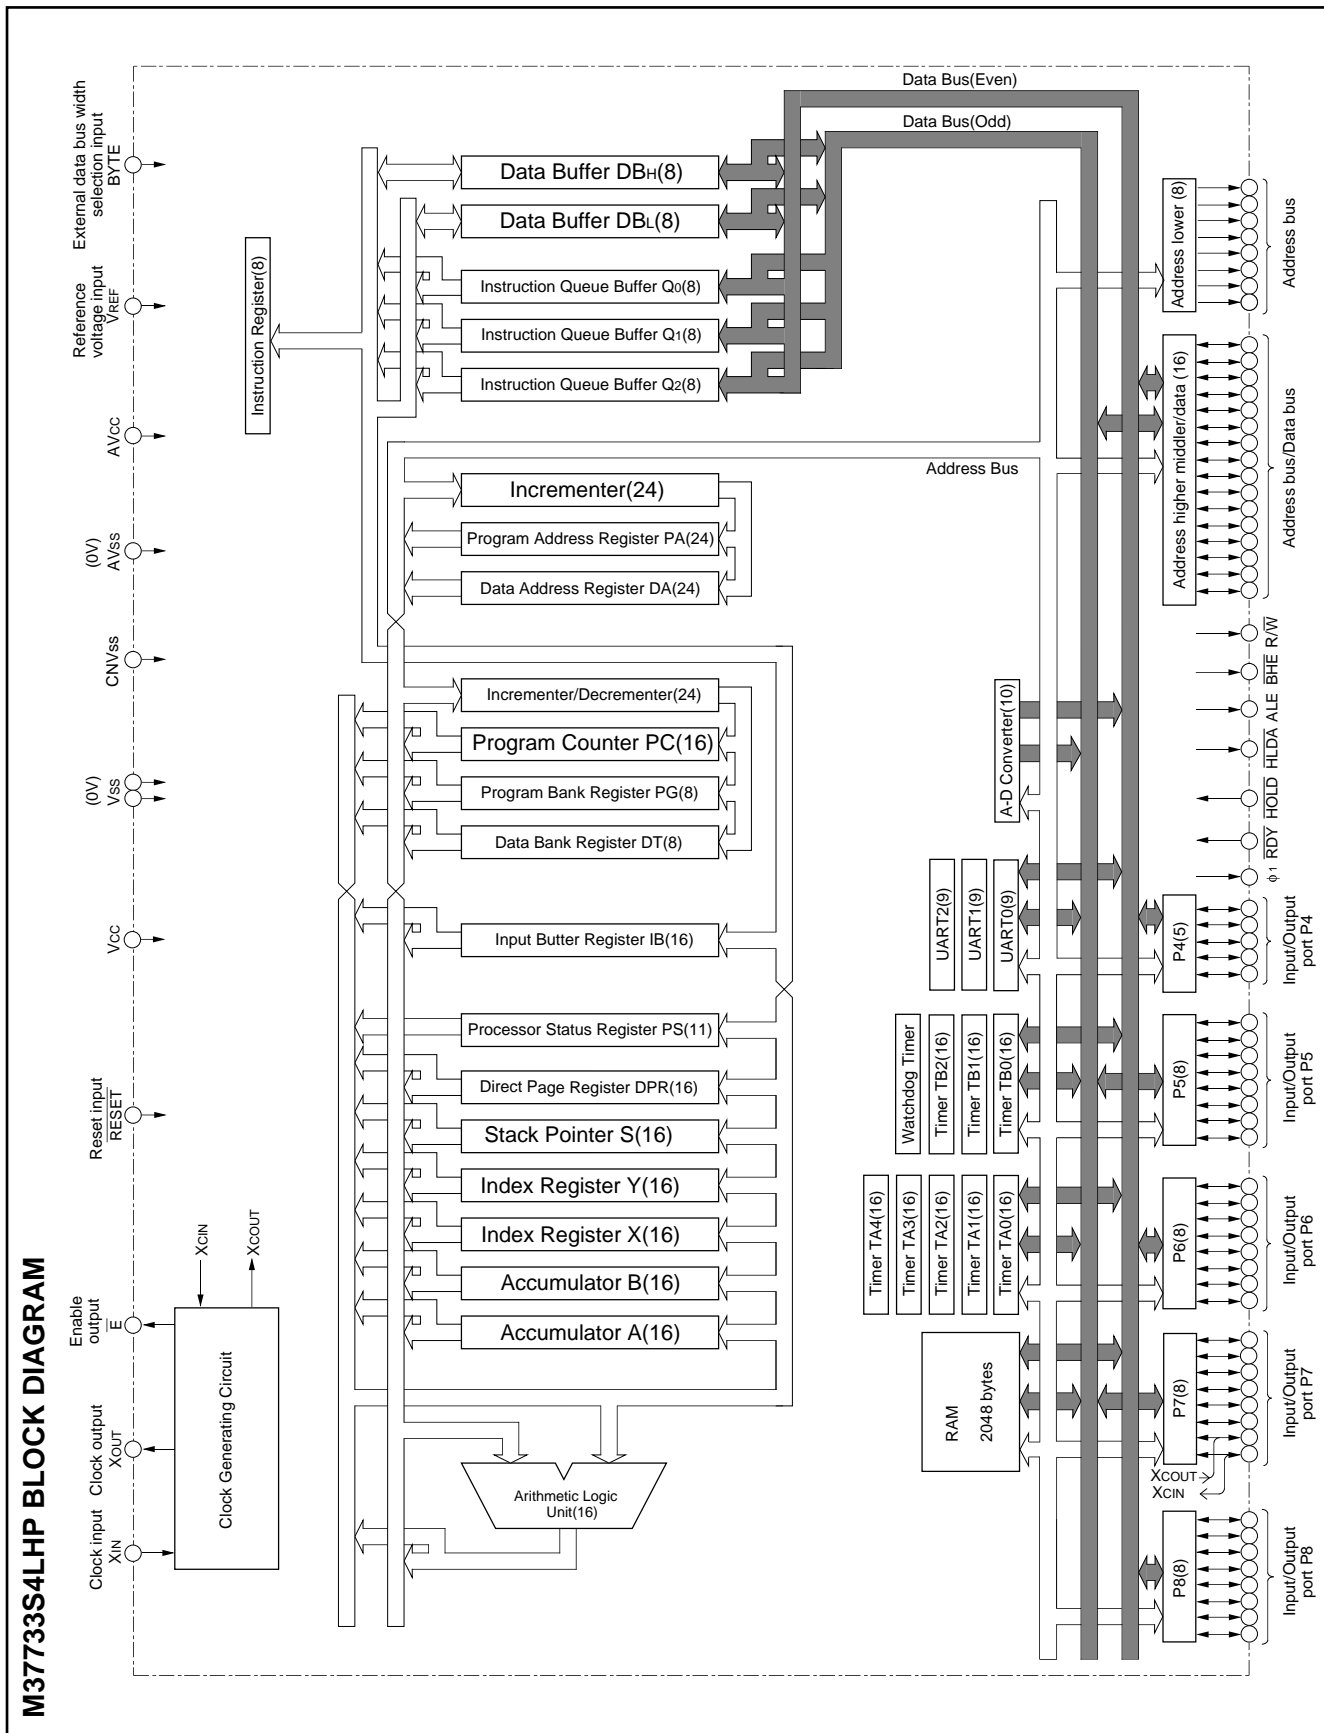

Control devices for general commercial equipment such as office automation, office equipment, personal information equipment, and so on.

Control devices for general industrial equipment such as communication equipment, and so on.

**PIN CONFIGURATION (TOP VIEW)**

New product

New product

**FUNCTIONS OF M37733S4LHP**

Parameter		Functions
Number of basic instructions		103
Instruction execution time		333 ns (the fastest instruction at external clock 12 MHz frequency)
Memory size	RAM	2048 bytes
Input/Output ports	P5 – P8	8-bit X 4
	P4	5-bit X 1
Multi-function timers	TA0, TA1, TA2, TA3, TA4	16-bit X 5
	TB0, TB1, TB2	16-bit X 3
Serial I/O		(UART or clock synchronous serial I/O) X 3
A-D converter		10-bit X 1 (8 channels)
Watchdog timer		12-bit X 1
Interrupts		3 external types, 16 internal types Each interrupt can be set to the priority level (0 – 7.)
Clock generating circuit		2 circuits built-in (externally connected to a ceramic resonator or a quartz-crystal oscillator)
Supply voltage		2.7 – 5.5 V
Power dissipation		10.8 mW (at 3 V supply voltage, external clock 12 MHz frequency) 27 mW (at 5 V supply voltage, external clock 12 MHz frequency)
Input/Output characteristic	Input/Output voltage	5 V
	Output current	5 mA
Memory expansion		Maximum 16 Mbytes
Operating temperature range		–40 to 85 °C
Device structure		CMOS high-performance silicon gate process
Package		80-pin plastic molded fine-pitch QFP (80P6D-A;0.5 mm lead pitch)

New product

## PIN DESCRIPTION

Pin	Name	Input/Output	Functions
V <sub>cc</sub> , V <sub>ss</sub>	Power source		Apply 2.7 – 5.5 V to V <sub>cc</sub> and 0 V to V <sub>ss</sub> .
CNV <sub>ss</sub>	CNV <sub>ss</sub> input	Input	Connect to V <sub>cc</sub> .
RESET	Reset input	Input	When "L" level is applied to this pin, the microcomputer enters the reset state.
X <sub>IN</sub>	Clock input	Input	These are pins of main-clock generating circuit. Connect a ceramic resonator or a quartz crystal oscillator between X <sub>IN</sub> and X <sub>OUT</sub> . When an external clock is used, the clock source should be connected to the X <sub>IN</sub> pin, and the X <sub>OUT</sub> pin should be left open.
X <sub>OUT</sub>	Clock output	Output	
$\bar{E}$	Enable output	Output	When output level of $\bar{E}$ signal is "L", data/instruction read or data write is performed.
BYTE	Bus width selection input	Input	This pin determines whether the external data bus has an 8-bit width or a 16-bit width. The data bus has a 16-bit width when "L" signal is input and an 8-bit width when "H" signal is input.
AV <sub>cc</sub> , AV <sub>ss</sub>	Analog power source input		Power source input pin for the A-D converter. Externally connect AV <sub>cc</sub> to V <sub>cc</sub> and AV <sub>ss</sub> to V <sub>ss</sub> .
V <sub>REF</sub>	Reference voltage input	Input	This is reference voltage input pin for the A-D converter.
P0 <sub>0</sub> /A <sub>0</sub> – P0 <sub>7</sub> /A <sub>7</sub>	Address (low-order) output	Output	Address (A <sub>0</sub> – A <sub>7</sub> ) is output.
P1 <sub>0</sub> /A <sub>8</sub> /D <sub>8</sub> – P1 <sub>7</sub> /A <sub>15</sub> /D <sub>15</sub>	Address (middle-order) output/data (high-order) I/O	I/O	When the BYTE pin is set to "L" and external data bus has a 16-bit width, high-order data (D <sub>8</sub> – D <sub>15</sub> ) is input/output or an address (A <sub>8</sub> – A <sub>15</sub> ) is output. When the BYTE pin is "H" and an external data bus has an 8-bit width, only address (A <sub>8</sub> – A <sub>15</sub> ) is output.
P2 <sub>0</sub> /A <sub>16</sub> /D <sub>0</sub> – P2 <sub>7</sub> /A <sub>23</sub> /D <sub>7</sub>	Address (high-order) output/data (low-order) I/O	I/O	Low-order data (D <sub>0</sub> – D <sub>7</sub> ) is input/output or an address (A <sub>16</sub> – A <sub>23</sub> ) is output.
P3 <sub>0</sub> /R $\bar{W}$	Read/Write output	Output	"H" indicates the read status and "L" indicates the write status.
P3 <sub>1</sub> /BHE	Byte high enable output	Output	"L" is output when an odd-numbered address is accessed.
P3 <sub>2</sub> /ALE	Address latch enable output	Output	This is used to retrieve only the address from address and data multiplex signal.
P3 <sub>3</sub> /HLDA	Hold acknowledge output	Output	This outputs "L" level when the microcomputer enters hold state after a hold request is accepted.
HOLD	Hold request input	Input	This is an input pin for HOLD request signal. The microcomputer enters into hold state while this signal is "L".
RDY	Ready input	Input	This is an input pin for RDY signal. The microcomputer enters into ready state while this signal is "L".
P4 <sub>2</sub> / $\phi$ 1	Clock output	Output	This pin outputs the clock $\phi$ 1.
P4 <sub>3</sub> – P4 <sub>7</sub>	I/O port P4	I/O	These pins become a 5-bit I/O port. An I/O direction register is available so that each pin can be programmed for input or output. These ports are in the input mode when reset.
P5 <sub>0</sub> – P5 <sub>7</sub>	I/O port P5	I/O	In addition to having the same functions as port P4, these pins also function as I/O pins for timers A0 to A3 and input pins for key input interrupt input (K <sub>I1</sub> – K <sub>I3</sub> ).
P6 <sub>0</sub> – P6 <sub>7</sub>	I/O port P6	I/O	In addition to having the same functions as port P4, these pins also function as I/O pins for timer A4, input pins for external interrupt input (INT <sub>0</sub> – INT <sub>2</sub> ) and input pins for timers B0 to B2. P6 <sub>7</sub> also functions as sub-clock $\phi$ sub output pin.
P7 <sub>0</sub> – P7 <sub>7</sub>	I/O port P7	I/O	In addition to having the same functions as port P4, these pins function as input pins for A-D converter. P7 <sub>2</sub> to P7 <sub>5</sub> also function as I/O pins for UART2. Additionally, P7 <sub>6</sub> and P7 <sub>7</sub> have the function as the output pin (X <sub>COUT</sub> ) and the input pin (X <sub>CIN</sub> ) of the sub-clock (32 kHz) oscillation circuit, respectively. When P7 <sub>6</sub> and P7 <sub>7</sub> are used as the X <sub>COUT</sub> and X <sub>CIN</sub> pins, connect a resonator or an oscillator between the both.
P8 <sub>0</sub> – P8 <sub>7</sub>	I/O port P8	I/O	In addition to having the same functions as port P4, these pins also function as I/O pins for UART 0 and UART 1.

New product

**BASIC FUNCTION BLOCKS**

The M37733S4LHP has the same functions as the M37733MHBXXXFP except for the following :

- (1) The memory map is different.
- (2) The processor mode is different.
- (3) The reset circuit is different.
- (4) Pulse output port mode of timer A is available.
- (5) The function of ROM area modification is not available.

**MEMORY**

The memory map is shown in Figure 1. The address space has a capacity of 16 Mbytes and is allocated to addresses from 0<sub>16</sub> to FFFFFFF<sub>16</sub>. The address space is divided by 64-Kbyte unit called bank. The banks are numbered from 0<sub>16</sub> to FF<sub>16</sub>.

Built-in RAM and control registers for internal peripheral devices are assigned to bank 0<sub>16</sub>.

Addresses FFD6<sub>16</sub> to FFFF<sub>16</sub> are the RESET and interrupt vector addresses and contain the interrupt vectors. Use ROM for memory of this address.

The 2048-byte area allocated to addresses from 80<sub>16</sub> to 87F<sub>16</sub> is the built-in RAM. In addition to storing data, the RAM is used as stack during a subroutine call or interrupts.

Peripheral devices such as I/O ports, A-D converter, serial I/O, timer, and interrupt control registers are allocated to addresses from 0<sub>16</sub> to 7F<sub>16</sub>.

A 256-byte direct page area can be allocated anywhere in bank 0<sub>16</sub> by using the direct page register (DPR). In the direct page addressing mode, the memory in the direct page area can be accessed with two words. Hence program steps can be reduced.

Fig. 1 Memory map

Fig. 2 Location of internal peripheral devices and interrupt control registers

New product

### Pulse output port mode

The pulse motor drive waveform can be output by using plural internal timer A.

Figure 3 shows a block diagram for pulse output port mode. In the pulse output port mode, two pairs of four-bit pulse output ports are used. Whether using pulse output port or not can be selected by waveform output selection bit (bit 0, bit 1) of waveform output mode register (62<sub>16</sub> address) shown in Figure 4. When bit 0 of waveform output selection bit is set to "1", RTP10, RTP11, RTP12, and RTP13 are used as pulse output ports, and when bit 1 of waveform output selection bit is set to "1", RTP00, RTP01, RTP02, and RTP03 are used as pulse output ports. When bits 1 and 0 of waveform output selection bit are set to "1", RTP10, RTP11, RTP12, and RTP13, and RTP00, RTP01, RTP02, and RTP03 are used as pulse output ports. The ports not used as pulse output ports can be used as normal parallel ports, timer input/output or key input interrupt input.

In the pulse output port mode, set timers A0 and A2 to timer mode as timers A0 and A2 are used. Figure 5 shows the bit configuration of timer A0, A2 mode registers in pulse output port mode.

Data can be set in each bit of the pulse output data register corresponding to four ports selected as pulse output ports. Figure 6

shows the bit configuration of the pulse output data register. The contents of the pulse output data register 1 (low-order four bits of 1C<sub>16</sub> address) corresponding to RTP10, RTP11, RTP12, and RTP13 is output to the ports each time the counter of timer A2 becomes 0000<sub>16</sub>. The contents of the pulse output data register 0 (low-order four bits of 1D<sub>16</sub> address) corresponding to RTP00, RTP01, RTP02, and RTP03 is output to the ports each time the counter of timer A0 becomes 0000<sub>16</sub>.

Figure 7 shows example of waveforms in pulse output port mode. When "0" is written to a specified bit of the pulse output data register, "L" level is output to the corresponding pulse output port when the counter of corresponding timer becomes 0000<sub>16</sub>, and when "1" is written, "H" level is output to the pulse output port.

Pulse width modulation can be applied to each pulse output port. Since pulse width modulation involves the use of timers A1 and A3, activate these timers in pulse width modulation mode.

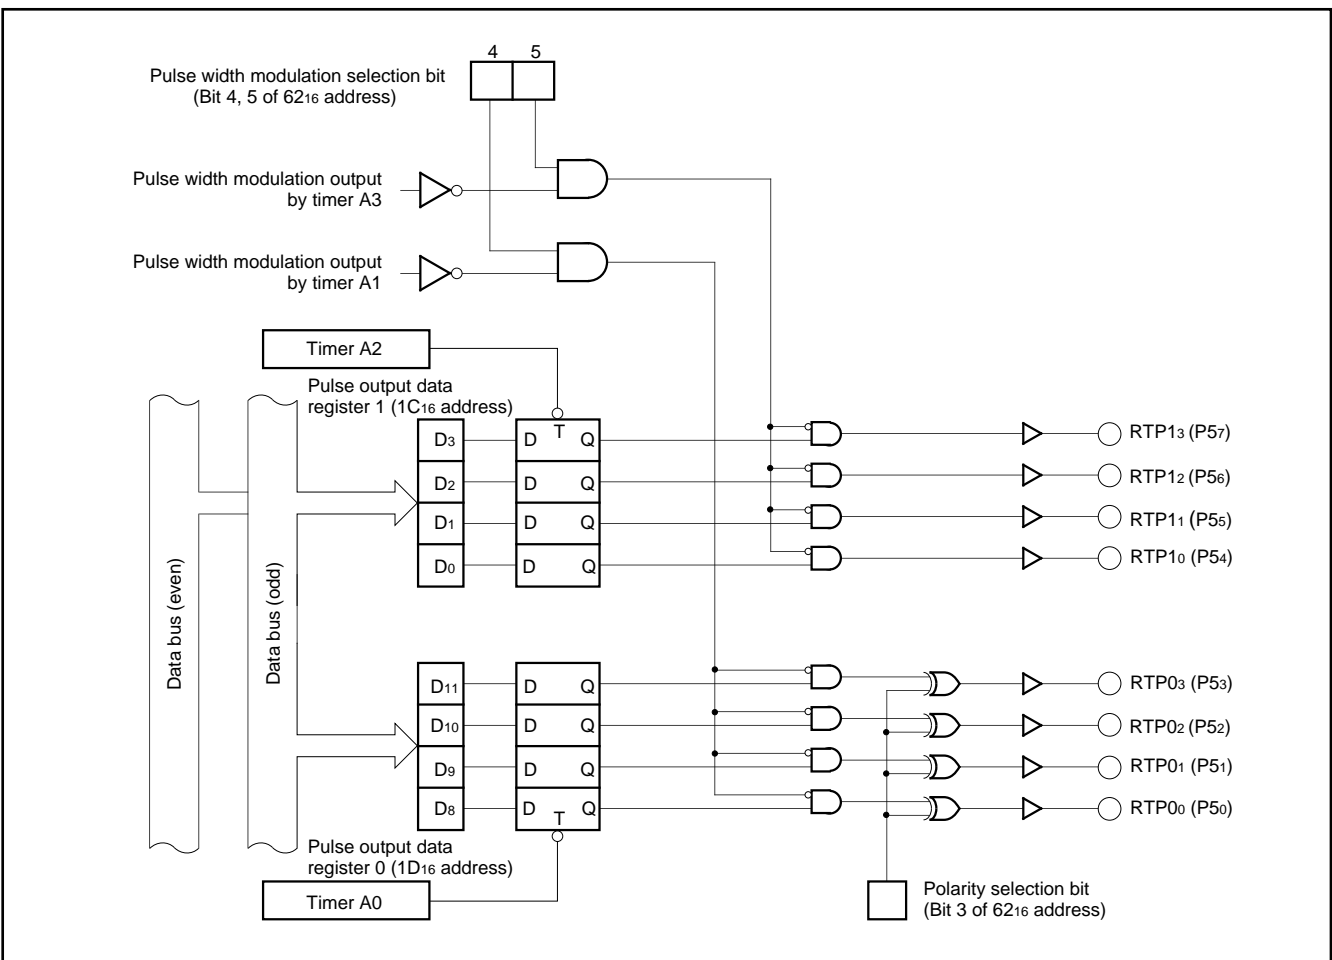

Fig. 3 Block diagram for pulse output port mode

New product

RTP10, RTP11, RTP12, and RTP13 are applied pulse width modulation by timer A3 by setting the pulse width modulation selection bit by timer A3 (bit 5) of the waveform output mode register to "1".

RTP00, RTP01, RTP02, and RTP03 are applied pulse width modulation by timer A1 by setting the pulse width modulation selection bit by timer A1 (bit 4) of the waveform output mode register to "1".

The contents of the pulse output data register 0 can be reversed and output to pulse output ports RTP00, RTP01, RTP02, and RTP03 by the polarity selection bit (bit 3) of the waveform output mode register. When the polarity selection bit is "0", the contents of the pulse output data register 0 is output unchangeably, and when "1", the contents of the pulse output data register 0 is reversed and output. When pulse width modulation is applied, likewise the polarity reverse to pulse width modulation can be selected by the polarity selection bit.

Fig. 4 Waveform output mode register bit configuration

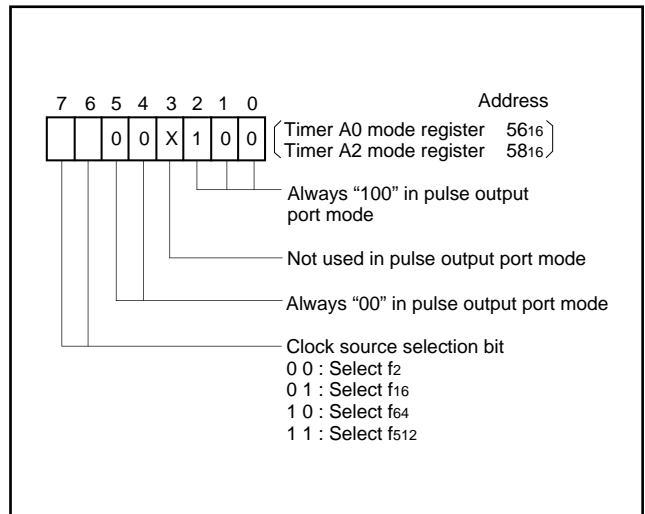

Fig. 5 Timer A0, A2 mode register bit configuration in pulse output port mode

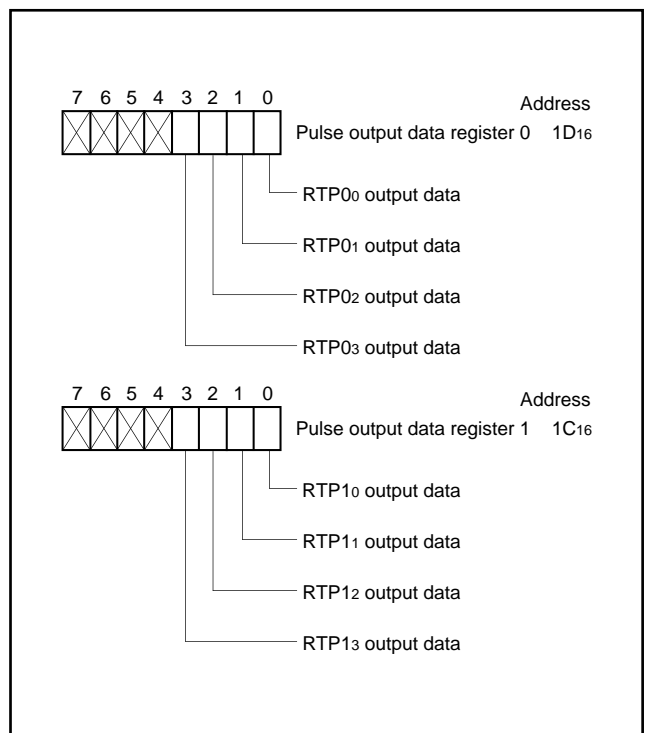

Fig. 6 Pulse output data register bit configuration

New product

Fig. 7 Example of waveforms in pulse output port mode

New product

**PROCESSOR MODE**

The bits 0 of processor mode register 0 as shown in Figure 8 is used to select which mode of microprocessor mode, and evaluation chip mode.

Figure 9 shows functions of P00/A0 to P47 pins in each mode.

The external memory area also changes when the mode changes.

Figure 10 shows the memory map for each mode.

The accessing of the external memory is affected by the BYTE pin, the bit 2 (wait bit) of processor mode register 0, and bit 0 (wait selection bit) of processor mode register 1.

**• BYTE pin**

When accessing the external memory, the level of the BYTE pin is used to determine whether to use the data bus as 8-bit width or 16-bit width.

The data bus width is 8 bits when the level of the BYTE pin is "H", and P20/A16/D0 to P27/A23/D7 pins become the data I/O pins.

The data bus width is 16 bits when the level of the BYTE pin is "L", and both P20/A16/D0 to P27/A23/D7 pins and P10/A8/D8 to P17/A15/D15 pins become the data I/O pins.

When accessing the internal memory, the data bus width is always 16 bits regardless of the BYTE pin level.

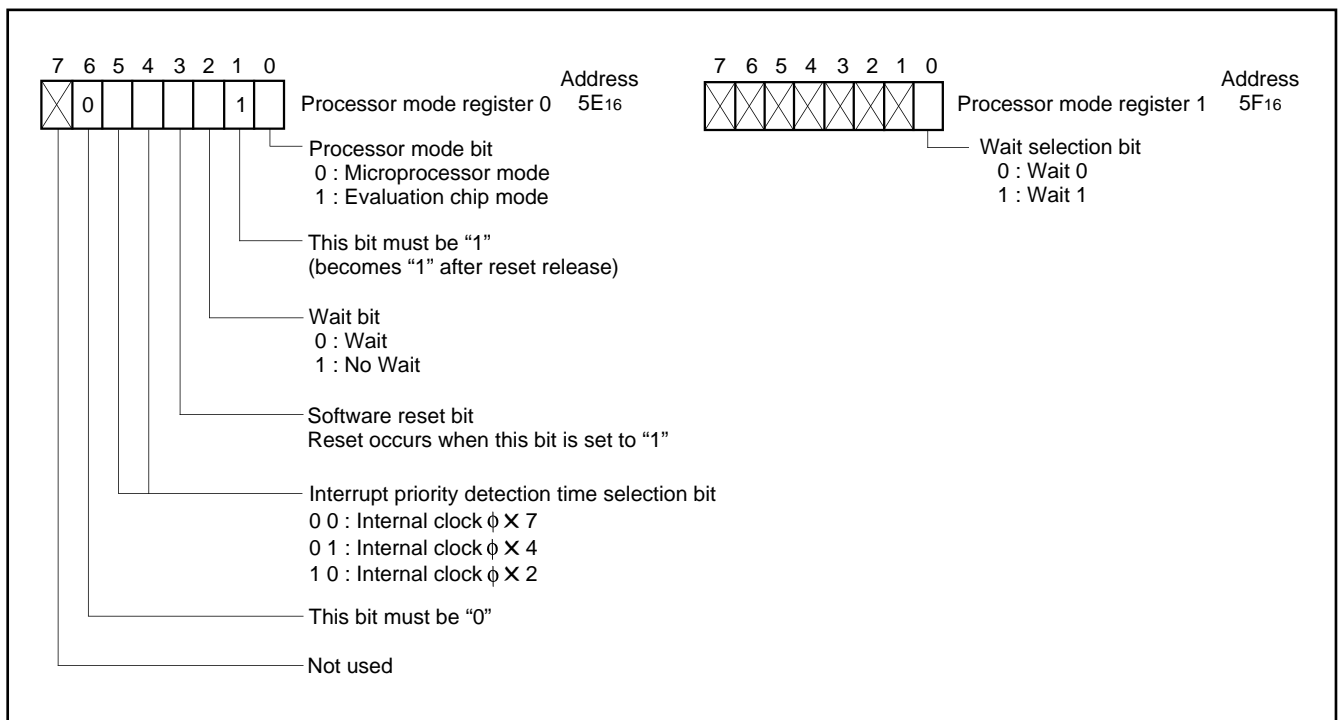

Fig. 8 Processor mode register bit configuration

New product

Pin	PM <sub>1</sub>	1	1
	PM <sub>0</sub>	0	1
Mode		Microprocessor mode	Evaluation Chip mode
P00/A0 - P07/A7			Same as left
P10/A8/D8   P17/A15/D15	BYTE = "L"		Same as left
	BYTE = "H"		<p>Ports P4, P5 and their direction registers are treated as 16-bit wide bus.</p>
P20/A16/D0   P27/A23/D7	BYTE = "L"		Same as left
	BYTE = "H"		<p>Ports P4, P5 and their direction registers are treated as 16-bit wide bus.</p>
P30/R/W, P31/BHE, P32/ALE, P33/HLDA			Same as left
HOLD, RDY, P42/φ 1, Port P43 to P47			

Fig. 9 Relationship between pins P00/A0 to P47 and processor modes

**Note.** The signal output disable selection bit (bit 6 of the oscillation circuit control register 0) can stop the φ 1 output in the microprocessor mode. In the microprocessor mode, signal E-bar can also be fixed to "H" when the internal memory area is accessed.

New product

• Wait bit

As shown in Figure 11, when the external memory area is accessed with the processor mode register 0 (address 5E16) bit 2 (wait bit) cleared to "0", the access time can be extended compared with no wait (the wait bit is "1").

The access time is extended in two ways and this is selected with bit 0 (wait selection bit) of processor mode register 1 (address 5F16).

When this bit is "1", the access time is 1.5 times compared to that for no wait. When this bit is "0", the access time is twice compared to that for no wait.

At reset, the wait bit and the wait selection bit are "0".

The accessing of internal memory area is performed in no wait mode regardless of the wait bit.

The processor modes are described below.

Fig. 10 External memory area for each processor mode

Fig. 11 Relationship between wait bit, wait selection bit, and access time

(1) Microprocessor mode [10]

Microprocessor mode is entered by connecting the CNVss pin to Vcc and starting from reset.

Signal  $\bar{E}$  is output from pin  $\bar{E}$  and is "L" during the data/instruction code read or data write term. When the internal memory area is read or written,  $\bar{E}$  can be fixed to "H" by setting the signal output disable selection bit (bit 6 of oscillation circuit control register 0) to "1".

P00/A0 to P07/A7 pins become address output pins.

P10/A8/D8 to P17/A15/D15 pins have two functions depending on the level of the BYTE pin.

When the BYTE pin level is "L", P10/A8/D8 to P17/A15/D15 pins function as an address output pin while  $\bar{E}$  is "H" and as an odd address data I/O pin while  $\bar{E}$  is "L". However, if an internal memory is read, external data is ignored while  $\bar{E}$  is "L".

When the BYTE pin level is "H", P10/A8/D8 to P17/A15/D15 pins function as an address output pin.

When the BYTE pin level is "L", P20/A16/D0 to P27/A23/D7 pins function as an address output pin while  $\bar{E}$  is "H" and as an even address data I/O pin while  $\bar{E}$  is "L". However, if an internal memory is read, external data is ignored while  $\bar{E}$  is "L".

$R/\bar{W}$  is a read/write signal which indicates a read when it is "H" and a write when it is "L".

$\bar{BHE}$  is a byte high enable signal which indicates that an odd address is accessed when it is "L".

Therefore, two bytes at even and odd addresses are accessed simultaneously if address A0 is "L" and  $\bar{BHE}$  is "L".

ALE is an address latch enable signal used to latch the address signal from a multiplexed signal of address and data. The latch is transparent while ALE is "H" to let the address signal pass through and held while ALE is "L".

New product

$\overline{HLDA}$  is a hold acknowledge signal and is used to notify externally when the microcomputer receives HOLD input and enters hold state. HOLD is a hold request signal. It is an input signal used to put the microcomputer in hold state. HOLD input is accepted when the internal clock  $\phi$  falls from "H" level to "L" level while the bus is not used. P00/A0 to P07/A7 pins, P10/A8/D8 to P17/A15/D15 pins, P20/A16/D0 to P27/A23/D7 pins, P30/R/W pin, and P31/ $\overline{BHE}$  pin are floating while the microcomputer stays in hold state. These pins are floating after one cycle of the internal clock  $\phi$  later than  $\overline{HLDA}$  signal changes to "L" level. At the removing of hold state, these ports are removed from floating state after one cycle of internal clock  $\phi$  later than  $\overline{HLDA}$  signal changes to "H" level.

RDY is a ready signal. If this signal goes "L", the internal clock  $\phi$  stops at "L". RDY is used when slow external memory is attached. P42/ $\phi$  1 pin is an output pin for clock  $\phi$  1. The  $\phi$  1 output is independent of RDY and does not stop even when internal clock  $\phi$  stops because of "L" input to the RDY pin. As shown in Table 2,  $\phi$  1 output can also be stopped with the signal output disable selection bit "1". In this case, write "1" to the port P42 direction register.

**(2) Evaluation chip mode [11]**

Evaluation chip mode is entered by applying voltage twice the Vcc voltage to the CNVss pin. This mode is normally used for evaluation tools.

The functions of  $\overline{E}$ , P00/A0 to P07/A7 pins, R/W,  $\overline{BHE}$ , ALE, and  $\overline{HLDA}$  are the same as those in microprocessor mode.

P10/A8/D8 to P17/A15/D15 pins function as address output pins while  $\overline{E}$  is "H" and as data I/O pin of odd addresses while  $\overline{E}$  is "L" regardless of the BYTE pin level. However, if an internal memory is read, external data is ignored while  $\overline{E}$  is "L". P20/A16/D0 to P27/A23/D7 pins function as address output pins while  $\overline{E}$  is "H" and as data I/O pin of even addresses while  $\overline{E}$  is "L" when the BYTE pin level is "L". However, if an internal memory is read, external data is ignored while  $\overline{E}$  is "L".

When the BYTE pin level is "H" or 2•Vcc, port P2 functions as an address output pin while  $\overline{E}$  is "H" and as data I/O pin of even and odd addresses while  $\overline{E}$  is "L". However, if an internal memory is read, external data is ignored while  $\overline{E}$  is "L".

Port P4 and its data direction which are located at address 0A16 and 0C16 are treated differently in evaluation chip mode. When these

addresses are accessed, the data bus width is treated as 16 bits regardless of the BYTE pin level, and the access cycle is treated as internal memory regardless of the wait bit.

The functions of HOLD and RDY are the same as those in microprocessor mode. Clock  $\phi$  1 from P42/ $\phi$  1 pin is always output regardless of signal output disable selection bit.

Ports P43 to P46 become MX, QCL, VDA, and VPA output pins respectively. Port P47 becomes the  $\overline{DBC}$  input pin.

The MX signal normally contents of flag m, but the contents of flag x is output if the CPU is using flag x.

QCL is the queue buffer clear signal. It becomes "H" when the instruction queue buffer is cleared, for example, when a jump instruction is executed.

VDA is the valid data address signal. It becomes "H" while the CPU is reading data from data buffer or writing data to data buffer. It also becomes "H" when the first byte of the instruction (operation code) is read from the instruction queue buffer.

VPA is the valid program address signal. It becomes "H" while the CPU is reading an instruction code from the instruction queue buffer.

$\overline{DBC}$  is the debug control signal and is used for debugging. Table 1 shows the relationship between the CNVss pin input levels and processor modes.

Table 1. Relationship between CNVss pin input levels and processor modes

CNVss	Mode	Description
Vss	• Microprocessor • Evaluation chip	Microprocessor mode upon starting after reset.
2 • Vcc	• Evaluation chip	Evaluation chip mode only.

Table 2. Function of signal output disable selection bit CM6 (bit 6 of oscillation circuit control register 0)

Processor mode	Pin	Function	
		CM6 = "0"	CM6 = "1"
Microprocessor mode	$\overline{E}$	$\overline{E}$ is output when the internal/external memory area is accessed. After WIT/STP instruction is executed, "H" is output.	$\overline{E}$ is output only when the external memory area is accessed. "L" is output after WIT/STP instruction is executed. * Standby state selection bit (bit 0 of port function control register) must be set to "1".
	$\phi$ 1	Clock $\phi$ 1 is output.	"H" or "L" is output. (Output the content of P42 latch.) * Port P42 direction register must be set to "1".

**Note.** Functions shown in Table 2 cannot be emulated in a debugger.

New product

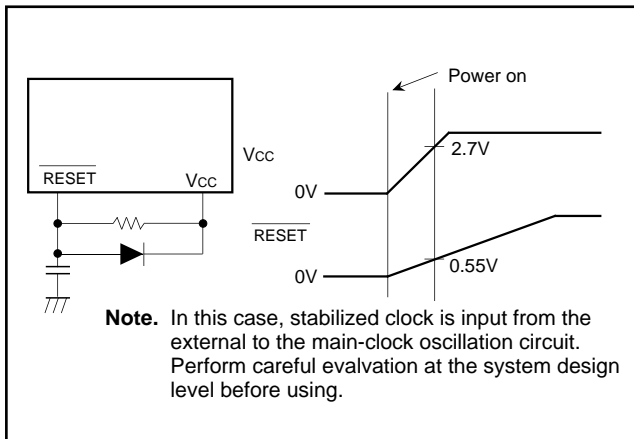

Fig. 13 Example of a reset circuit

### ADDRESSING MODES

The M37733S4LHP has 28 powerful addressing modes. Refer to the MITSUBISHI SEMICONDUCTORS DATA BOOK SINGLE - CHIP 16-BIT MICROCOMPUTERS for the details of each addressing mode.

### MACHINE INSTRUCTION LIST

The M37733S4LHP has 103 machine instructions. Refer to the MITSUBISHI SEMICONDUCTORS DATA BOOK SINGLE - CHIP 16-BIT MICROCOMPUTERS for details.

New product

**ABSOLUTE MAXIMUM RATINGS**

Symbol	Parameter	Conditions	Ratings	Unit
V <sub>cc</sub>	Power source voltage		-0.3 to +7	V
AV <sub>cc</sub>	Analog power source voltage		-0.3 to +7	V

V <sub>IH</sub>	High-level input voltage P10/A8/D8 – P17/A15/D15, P20/A16/D0 – P27/A23/D7	0.5 V <sub>cc</sub>		V <sub>cc</sub>	V
V <sub>IL</sub>	Low-level input voltage HOLD, RDY, P43 – P47, P50 – P57, P60 – P67, P70 – P77, P80 – P87, X <sub>IN</sub> , RESET, CNV <sub>ss</sub> , BYTE, X <sub>CIN</sub> (Note 3)	0		0.2V <sub>cc</sub>	V
V <sub>IL</sub>	Low-level input voltage P10/A8/D8 – P17/A15/D15, P20/A16/D0 – P27/A23/D7	0		0.16V <sub>cc</sub>	V
I <sub>OH(peak)</sub>	High-level peak output current P00/A0 – P07/A7, P10/A8/D8 – P17/A15/D15, P20/A16/D0 – P27/A23/D7, P30/R/W, P31/BHE, P32/ALE, P33/HLDA, P42/ φ 1, P43 – P47, P50 – P57, P60 – P67, P70 – P77, P80 – P87			-10	mA
I <sub>OH(avg)</sub>	High-level average output current P00/A0 – P07/A7, P10/A8/D8 – P17/A15/D15, P20/A16/D0 – P27/A23/D7, P30/R/W, P31/BHE, P32/ALE, P33/HLDA, P42/ φ 1, P43 – P47, P50 – P57, P60 – P67, P70 – P77, P80 – P87			-5	mA
I <sub>OL(peak)</sub>	Low-level peak output current P00/A0 – P07/A7, P10/A8/D8 – P17/A15/D15, P20/A16/D0 – P27/A23/D7, P30/R/W, P31/BHE, P32/ALE, P33/HLDA, P42/ φ 1, P43, P54 – P57, P60 – P67, P70 – P77, P80 – P87			10	mA
I <sub>OL(peak)</sub>	Low-level peak output current P44 – P47, P50 – P53			16	mA
I <sub>OL(avg)</sub>	Low-level average output current P00/A0 – P07/A7, P10/A8/D8 – P17/A15/D15, P20/A16/D0 – P27/A23/D7, P30/R/W, P31/BHE, P32/ALE, P33/HLDA, P42/ φ 1, P43, P54 – P57, P60 – P67, P70 – P77, P80 – P87			5	mA
I <sub>OL(avg)</sub>	Low-level average output current P44 – P47, P50 – P53			12	mA
f(X <sub>IN</sub> )	Main-clock oscillation frequency (Note 4)			12	MHz
f(X <sub>CIN</sub> )	Sub-clock oscillation frequency		32.768	50	kHz

- Notes**
1. Average output current is the average value of a 100 ms interval.
  2. The sum of I<sub>OL(peak)</sub> for ports P00/A0 – P07/A7, P10/A8/D8 – P17/A15/D15, P20/A16/D0 – P27/A23/D7, P30/R/W, P31/BHE, P32/ALE, P33/HLDA and P8 must be 80 mA or less, the sum of I<sub>OH(peak)</sub> for ports P00/A0 – P07/A7, P10/A8/D8 – P17/A15/D15, P20/A16/D0 – P27/A23/D7, P30/R/W, P31/BHE, P32/ALE, P33/HLDA and P8 must be 80 mA or less, the sum of I<sub>OL(peak)</sub> for ports P4, P5, P6, and P7 must be 100 mA or less, and the sum of I<sub>OH(peak)</sub> for ports P4, P5, P6, and P7 must be 80 mA or less.
  3. Limits V<sub>IH</sub> and V<sub>IL</sub> for X<sub>CIN</sub> are applied when the sub clock external input selection bit = "1".
  4. The maximum value of f(X<sub>IN</sub>) = 6 MHz when the main clock division selection bit = "1".

New product

Symbol	Parameter	Limits		Unit
		Min.	Max.	
t <sub>c</sub> (TB)	TBiIN input cycle time (Note)	666		ns
t <sub>w</sub> (TBH)	TBiIN input high-level pulse width (Note)	333		ns
t <sub>w</sub> (TBL)	TBiIN input low-level pulse width (Note)	333		ns

**Note.** Limits change depending on f(X<sub>IN</sub>). Refer to "DATA FORMULAS."

**A-D trigger input**

Symbol	Parameter	Limits		Unit
		Min.	Max.	
t <sub>c</sub> (AD)	AD <sub>TRG</sub> input cycle time (minimum allowable trigger)	1333		ns
t <sub>w</sub> (ADL)	AD <sub>TRG</sub> input low-level pulse width	166		ns

**Serial I/O**

Symbol	Parameter	Limits		Unit
		Min.	Max.	
t <sub>c</sub> (CK)	CLK <sub>i</sub> input cycle time	333		ns
t <sub>w</sub> (CKH)	CLK <sub>i</sub> input high-level pulse width	166		ns
t <sub>w</sub> (CKL)	CLK <sub>i</sub> input low-level pulse width	166		ns
t <sub>d</sub> (C-Q)	TxD <sub>i</sub> output delay time		100	ns
t <sub>h</sub> (C-Q)	TxD <sub>i</sub> hold time	0		ns
t <sub>su</sub> (D-C)	RxD <sub>i</sub> input setup time	65		ns
t <sub>h</sub> (C-D)	RxD <sub>i</sub> input hold time	75		ns

**External interrupt INT<sub>i</sub> input, key input interrupt KI<sub>i</sub> input**

Symbol	Parameter	Limits		Unit
		Min.	Max.	
t <sub>w</sub> (INH)	INT <sub>i</sub> input high-level pulse width	250		ns
t <sub>w</sub> (INL)	INT <sub>i</sub> input low-level pulse width	250		ns
t <sub>w</sub> (KIL)	KI <sub>i</sub> input low-level pulse width	250		ns

New product

## DATA FORMULAS

**Timer A input** (Gating input in timer mode)

Symbol	Parameter	Limits		Unit
		Min.	Max.	
$t_{c(TA)}$	TAiIN input cycle time	$\frac{8 \times 10^9}{2 \cdot f(f_2)}$		ns
$t_{w(TAH)}$	TAiIN input high-level pulse width	$\frac{4 \times 10^9}{2 \cdot f(f_2)}$		ns
$t_{w(TAL)}$	TAiIN input low-level pulse width	$\frac{4 \times 10^9}{2 \cdot f(f_2)}$		ns

**Timer A input** (External trigger input in one-shot pulse mode)

Symbol	Parameter	Limits		Unit
		Min.	Max.	
$t_{c(TA)}$	TAiIN input cycle time	$\frac{8 \times 10^9}{2 \cdot f(f_2)}$		ns

**Timer B input** (In pulse period measurement mode or pulse width measurement mode)

Symbol	Parameter	Limits		Unit
		Min.	Max.	
$t_{c(TB)}$	TBiIN input cycle time	$\frac{8 \times 10^9}{2 \cdot f(f_2)}$		ns
$t_{w(TBH)}$	TBiIN input high-level pulse width	$\frac{4 \times 10^9}{2 \cdot f(f_2)}$		ns
$t_{w(TBL)}$	TBiIN input low-level pulse width	$\frac{4 \times 10^9}{2 \cdot f(f_2)}$		ns

**Note.**  $f(f_2)$  expresses the clock  $f_2$  frequency.

For the relation to the main clock and sub clock, refer to Table 9 in data sheet "M37733MHBXXXFP".

New product

SWITCHING CHARACTERISTICS

(Vcc = 2.7 - 5.5 V, Vss = 0 V, Ta = -40 to +85°C, f(XIN) = 12 MHz, unless otherwise noted (Note))

Microprocessor mode

Symbol	Parameter	Test conditions	Limits		Unit
			Min.	Max.	
td(E-P4Q)	Port P4 data output delay time	Fig. 14		300	ns
td(E-P5Q)	Port P5 data output delay time			300	ns
td(E-P6Q)	Port P6 data output delay time			300	ns
td(E-P7Q)	Port P7 data output delay time			300	ns
td(E-P8Q)	Port P8 data output delay time			300	ns

Note. This applies when the main clock division selection bit = "0" and f(f2) = 6 MHz.

Fig. 14 Measuring circuit for each pin

New product

**Microprocessor mode**

(VCC = 2.7 – 5.5 V, VSS = 0 V, Ta = –40 to +85 °C, f(XIN) = 12 MHz, unless otherwise noted (Note 1))

Symbol	Parameter	(Note2) Wait mode	Test conditions	Limits		Unit
				Min.	Max.	
td(An–E)	Address output delay time	No wait	Fig. 14	20		ns
		Wait 1				
		Wait 0		182		ns
td(A–E)	Address output delay time	No wait		20		ns
		Wait 1				
		Wait 0		162		ns
th(E–An)	Address hold time			40		ns
tw(ALE)	ALE pulse width	No wait		40		ns
		Wait 1				
		Wait 0		123		ns
tsu(A–ALE)	Address output setup time	No wait		10		ns
		Wait 1				
		Wait 0		93		ns
th(ALE–A)	Address hold time	No wait		9		ns
		Wait 1				
		Wait 0	40		ns	
td(ALE–E)	ALE output delay time	No wait	4		ns	
		Wait 1				
		Wait 0	40		ns	
td(E–DQ)	Data output delay time					
th(E–DQ)	Data hold time			90	ns	
tw(EL)	$\bar{E}$ pulse width	No wait	131		ns	
		Wait 1				
		Wait 0	298		ns	
tpxz(E–DZ)	Floating start delay time			10	ns	
tpzx(E–DZ)	Floating release delay time		53		ns	
td(BHE–E)	$\bar{BHE}$ output delay time	No wait	20		ns	
		Wait 1				
		Wait 0	182		ns	
td(R/W–E)	R/W output delay time	No wait	20		ns	
		Wait 1				
		Wait 0	182		ns	
th(E–BHE)	$\bar{BHE}$ hold time		33		ns	
th(E–R/W)	R/W hold time		33		ns	
td(E– $\phi$ 1)	$\phi$ 1 output delay time		0	30	ns	
td( $\phi$ 1–HLDA)	$\bar{HLDA}$ output delay time			120	ns	

**Notes 1.** This applies when the main clock division selection bit = “0” and f(f2) = 6 MHz.

**2.** No wait : Wait bit = “1”.

Wait 1 : The external memory area is accessed with wait bit = “0” and wait selection bit = “1”.

Wait 0 : The external memory area is accessed with wait bit = “0” and wait selection bit = “0”.

**Keep safety first in your circuit designs!**

- Mitsubishi Electric Corporation puts the maximum effort into making semiconductor products better and more reliable, but there is always the possibility that trouble may occur with them. Trouble with semiconductors may lead to personal injury, fire or property damage. Remember to give due consideration to safety when making your circuit designs, with appropriate measures such as (i) placement of substitute, auxiliary circuits, (ii) use of non-flammable material or (iii) prevention against any malfunction or mishap.

**Notes regarding these materials**

- These materials are intended as a reference to assist our customers in the selection of the Mitsubishi semiconductor product best suited to the customer's application; they do not convey any license under any intellectual property rights, or any other rights, belonging to Mitsubishi Electric Corporation or a third party.
- Mitsubishi Electric Corporation assumes no responsibility for any damage, or infringement of any third-party's rights, originating in the use of any product data, diagrams, charts or circuit application examples contained in these materials.
- All information contained in these materials, including product data, diagrams and charts, represent information on products at the time of publication of these materials, and are subject to change by Mitsubishi Electric Corporation without notice due to product improvements or other reasons. It is therefore recommended that customers contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for the latest product information before purchasing a product listed herein.
- Mitsubishi Electric Corporation semiconductors are not designed or manufactured for use in a device or system that is used under circumstances in which human life is potentially at stake. Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor when considering the use of a product contained herein for any specific purposes, such as apparatus or systems for transportation, vehicular, medical, aerospace, nuclear, or undersea repeater use.
- The prior written approval of Mitsubishi Electric Corporation is necessary to reprint or reproduce in whole or in part these materials.
- If these products or technologies are subject to the Japanese export control restrictions, they must be exported under a license from the Japanese government and cannot be imported into a country other than the approved destination.  
Any diversion or reexport contrary to the export control laws and regulations of Japan and/or the country of destination is prohibited.
- Please contact Mitsubishi Electric Corporation or an authorized Mitsubishi Semiconductor product distributor for further details on these materials or the products contained therein.
