

S6510P

SIMPLE BALLAST CONTROLLER

Description

The device provides simple and performance electronics ballast control function for the half bridge L/C resonant inverter. This device is optimized for electronics ballast requiring a minimum board area, reduced component count and low power dissipation. Internal soft start circuitry eliminates the need for an external soft start PTC resistor. The initial soft start frequency and soft start time can be easily adjusted depending on the types of lamp. Prevent burning out of switches in no lamp condition. Internal 18V regulator clamps Vcc line of supply voltage for eliminating an external zener diode.

Features

- No lamp protection
- Low Start up & Operating Current
- Internal Soft Start
- Flexible Soft Start Frequency
- Trimmed 1.5% internal Reference
- Under Voltage Lock Out with Hysteresis
- High Current Totem Pole Gate Drive

PIN Collection

Pin Number	Pin Name	Pin Function Description
1	Cs	Soft start time capacitor connection pin. The pin charge time to Vref determines The preheating time of lamp.
2	C _T	Timing capacitor connection pin. The timing capacitor is charged and discharged To generate the sawtooth waveform that determines the oscillator frequency in the internal oscillator.
3	Rs	Soft start resistor connection pin. The soft start resistor value determines the initial soft start frequency for preheating.
4	Ldet	Input to the protection circuit. If the pin voltage is lower than Vref, the output oh The output driver1,2 is inhibited.
5	GND	Ground of the control Section.
6	OUT2	Gate drive output. A push pull output stage is able to drive the Power MOSFET With peak current of 400mA.
7	OUT1	Gate drive output. A push pull output stage is able to drive the Power MOSFET With peak current of 400mA.
8	Vcc	Supply Voltage of output driver and control circuits.
