S72NxxSF

Standard Voltage Detector

Description

The function of this low reset Type IC is to accurately reset systems after detecting the supply voltage at the time of switching power on and instantaneous power off in various CPU and other logic system. Further, this IC, with its super low consumption current is most suited as a voltage check circuit for a number of products which use batteries.

Features

- Super low current consumption (I_{CCL} = 1.0uA Typ.)
- High current of output transistor (I_{OL}=20mA Typ.)
- Hysteresis circuit built in ($\triangle V_S$=100mV Typ.)
- It has on delay function to supplement the constant of outer C and R.

Applications

- Reset circuits for microcomputers, CPU and MPU.
- Reset circuit for logic circuitry.
- Battery voltage check circuit.
- Circuit for changing over to backup battery.
- Level detecting circuit.

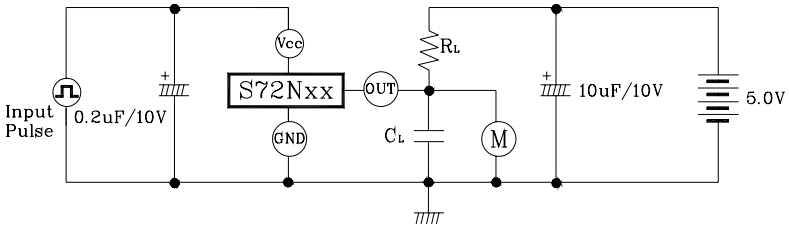
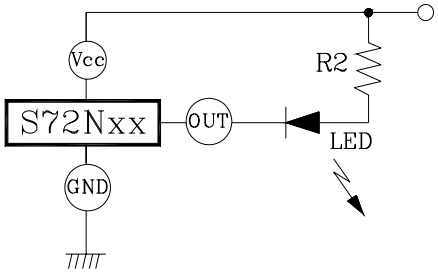
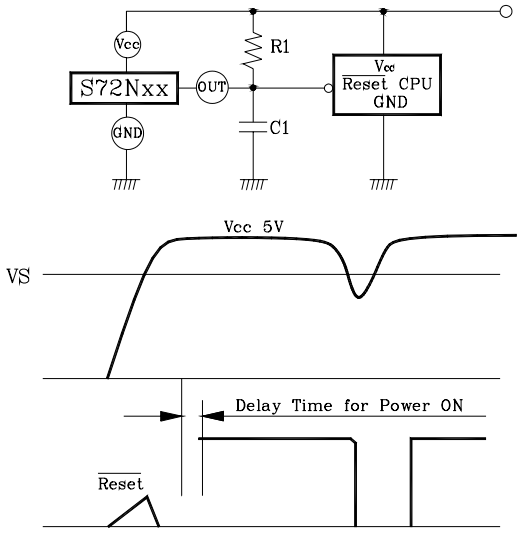
Test Circuit 2



Application Circuit

(1) Battery Low Indicator





(Note)

(1) Connecting of LED and R2 obtains a voltage drop indicator.

(2) Connecting of C1 and selection of time constant with C1 and R1 set the power on delay time.
