Radio tuning PLL frequency synthesizer

SAA1057

GENERAL DESCRIPTION

The SAA1057 is a single chip frequency synthesizer IC in I<sup>2</sup>L technology, which performs all the tuning functions of a PLL radio tuning system. The IC is applicable to all types of radio receivers, e.g. car radios, hi-fi radios and portable radios.

Features

- On-chip prescaler with up to 120 MHz input frequency.
- On-chip AM and FM input amplifiers with high sensitivity (30 mV and 10 mV respectively).
- Low current drain (typically 16 mA for AM and 20 mA for FM) over a wide supply voltage range (3,6 V to 12 V).
- On-chip amplifier for loop filter for both AM and FM (up to 30 V tuning voltage).

- On-chip programmable current amplifier (charge pump) to adjust the loop gain.
- Only one reference frequency for both AM and FM.
- High signal purity due to a sample and hold phase detector for the in-lock condition.
- High tuning speed due to a powerful digital memory phase detector during the out-lock condition.
- Tuning steps for AM are: 1 kHz or 1,25 kHz for a VCO frequency range of 512 kHz to 32 MHz.
- Tuning steps for FM are: 10 kHz or 12,5 kHz for a VCO frequency range of 70 MHz to 120 MHz.
- Serial 3-line bus interface to a microcomputer.
- Test/features.

QUICK REFERENCE DATA

Supply voltage ranges	V <sub>CC1</sub>	3,6 to 12	V
	V <sub>CC2</sub>	3,6 to 12	V
	V <sub>CC3</sub>	V <sub>CC2</sub> to 31	V
Supply currents	I <sub>CC1</sub> + I <sub>CC2</sub>	typ. 18	mA
	I <sub>CC3</sub>	typ. 0,8	mA
Input frequency ranges			
at pin FAM	f <sub>FAM</sub>	512 kHz to 32	MHz
at pin FFM	f <sub>FFM</sub>	70 to 120	MHz
Maximum crystal input frequency	f <sub>XTAL</sub>	> 4	MHz
Operating ambient temperature range	T <sub>amb</sub>	−25 to + 80	°C

## Radio tuning PLL frequency synthesizer

## SAA1057

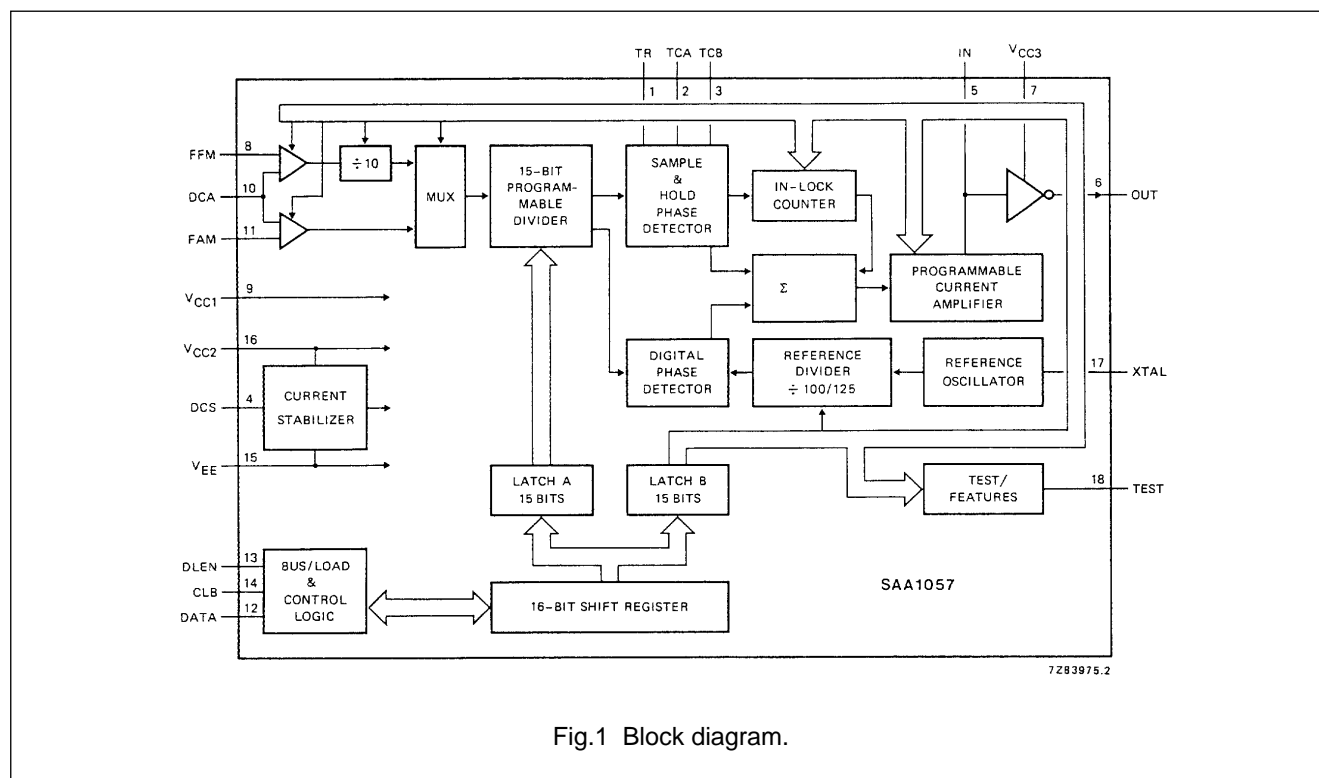

Fig.1 Block diagram.

## GENERAL DESCRIPTION

The SAA1057 performs the entire PLL synthesizer function (from frequency inputs to tuning voltage output) for all types of radios with the AM and FM frequency ranges.

The circuit comprises the following:

- Separate input amplifiers for the AM and FM VCO-signals.
- A divider-by-10 for the FM channel.
- A multiplexer which selects the AM or FM input.
- A 15-bit programmable divider for selecting the required frequency.
- A sample and hold phase detector for the in-lock condition, to achieve the high spectral purity of the VCO signal.
- A digital memory frequency/phase detector, which operates at a 32 times higher frequency than the sample and hold phase detector, so fast tuning can be achieved.
- An in-lock counter detects when the system is in-lock. The digital phase detector is switched-off automatically when an in-lock condition is detected.
- A reference frequency oscillator followed by a reference divider. The frequency is generated by a 4 MHz quartz crystal. The reference frequency can be chosen either 32 kHz or 40 kHz for the digital phase detector (that means 1 kHz and 1,25 kHz for the sample and hold phase detector), which results in tuning steps of 1 kHz and 1,25 kHz for AM, and 10 kHz and 12,5 kHz for FM.
- A programmable current amplifier (charge pump), which controls the output current of both the digital and the sample/hold phase detector in a range of 40 dB. It also allows the loop gain of the tuning system to be adjusted by the microcomputer.
- A tuning voltage amplifier, which can deliver a tuning voltage of up to 30 V.
- BUS; this circuitry consists of a format control part, a 16-bit shift register and two 15-bit latches. Latch A contains the to be tuned frequency information in a binary code. This binary-coded number, multiplied by the tuning spacing, is equal to the synthesized frequency. The programmable divider (without the fixed divide-by-10 prescaler for FM) can be programmed in a range between 512 and 32 767 (see Fig.3). Latch B contains the control information.

## Radio tuning PLL frequency synthesizer

## SAA1057

## OPERATION DESCRIPTION

## Control information

The following functions can be controlled with the data word bits in latch B. For data word format and bit position see Fig.3.

FM	FM/AM selection; '1' = FM, '0' = AM
REFH	reference frequency selection; '1' = 1,25 kHz, '0' = 1 kHz (sample and hold phase detector)
CP3	control bits for the programmable current amplifier (see section Characteristics)
CP2	
CP1	
CP0	
SB2	enables last 8 bits (SLA to T0) of data word B; '1' = enables, '0' = disables; when programmed '0', the last 8 bits of data word B will be set to '0' automatically
SLA	load mode of latch A; '1' = synchronous, '0' = asynchronous
PDM1	phase detector mode
PDM0	

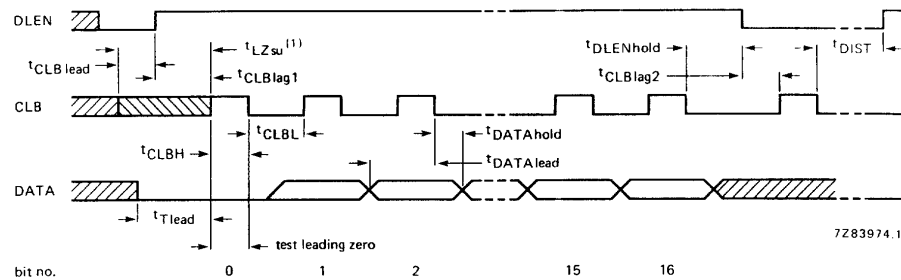

PDM1	PDM0	digital phase detector
0	X	automatic on/off
1	0	on
1	1	off

BRM	bus receiver mode bit; in this mode the supply current of the BUS receiver will be switched-off automatically after a data transmission (current-draw is reduced); '1' = current switched; '0' = current always on
T3	test bit; must be programmed always '0'
T2	test bit; selects the reference frequency (32 or 40 kHz) to the TEST pin
T1	test bit; must be programmed always '0'
T0	test bit; selects the output of the programmable counter to the TEST pin

T3	T2	T1	T0	TEST (pin 18)
0	0	0	0	1
0	1	0	0	reference frequency
0	0	0	1	output programmable counter
0	1	0	1	output in-lock counter '0' = out-lock '1' = in-lock

Radio tuning PLL frequency synthesizer

SAA1057

(1) During the zero set-up time ( $t_{LZsu}$ ) CLB can be LOW or HIGH, but no transient of the signal is permitted. This can be of use when an I<sup>2</sup>C bus is used for other devices on the same data and clock lines.

## Radio tuning PLL frequency synthesizer

## SAA1057

### Notes

1. Pin 17 (XTAL) can also be used as input for an external clock.  
The circuit for that is given in Fig.5. The values given in Fig.5 are a typical application example.
2. See BUS information in section 'operation description'.
3. The output voltage at TCB and TCA is typically  $\frac{1}{2} V_{CC2} + 0,3$  when the tuning system is in-lock via the sample and hold phase detector. The control voltage at TCB is defined as the difference between the actual voltage at TCB and the value calculated from the formula  $\frac{1}{2} V_{CC2} + 0,3$  V.
4. Crystal oscillator frequency  $f_{XTAL} = 4$  MHz.
5. The busy-time after word "A" to another device which has more clock pulses than the SAA1057 (>17) must be the same as the busy-time for a next transmission to the SAA1057.  
When the other device has a separate DLEN or has less clock pulses than the SAA1057 it is not necessary to keep to this busy-time, 5  $\mu$ s will be sufficient.
6. When the bus is in the active mode (see BRM in Control Information), 4,5 mA should be added to the figures given.
7. Open collector output.
8. Measured in Fig.6.

Fig.5 Circuit configuration showing external 4 MHz clock.

### APPLICATION INFORMATION

#### Initialize procedure

Either a train of at least 10 clock pulses should be applied to the clock input (CLB) or word B should be transmitted, to achieve proper initialization of the device.

For the complete initialization (defining all control bits) a transmission of word B should follow. This means that the IC is ready to accept word A.

#### Synchronous/asynchronous operation

Synchronous loading of the frequency word into the programmable counter can be achieved when bit 'SLA' of word B is set to '1'. This mode should be used for small frequency steps where low tuning noise is important (e.g. search and manual tuning). This mode should not be used for frequency changes of more than 31 tuning steps. In this case asynchronous loading is necessary. This is achieved by setting bit 'SLA' to '0'. The in-lock condition will then be reached more quickly, because the frequency information is loaded immediately into the divider.

#### Restrictions to the use of the programmable current amplifier

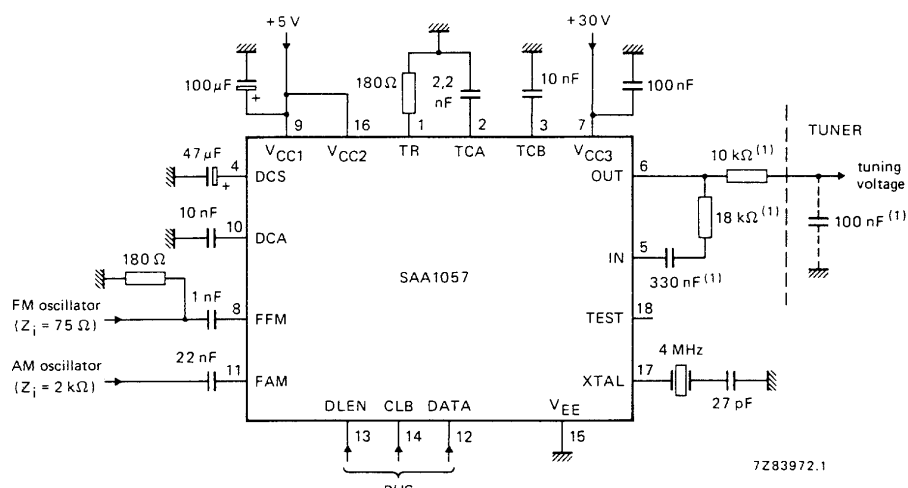

The lowest current gain (0,023) must not be used in the in-lock condition when the supply voltage  $V_{CC2}$  is below 5 V (CP3, CP2, CP1 and CP0 are all set to '0'). This is to avoid possible instability of the loop due to a too small range of the sample and hold phase detector in this condition (see also section 'Characteristics').

## Radio tuning PLL frequency synthesizer

## SAA1057

## Transient times of the bus signals

When the SAA1057 is operating in a system with continuous activity on the bus lines, the transient times at the bus inputs should not be less than 100 ns. Otherwise the signal-to-noise ratio of the tuning voltage is reduced.

(1) Values depend on the tuner diode characteristics.

## SOLDERING

### Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

### Soldering by dipping or by wave

The maximum permissible temperature of the solder is 260 °C; solder at this temperature must not be in contact with the joint for more than 5 seconds. The total contact time of successive solder waves must not exceed 5 seconds.

The device may be mounted up to the seating plane, but the temperature of the plastic body must not exceed the specified maximum storage temperature ( $T_{stg\ max}$ ). If the printed-circuit board has been pre-heated, forced cooling may be necessary immediately after soldering to keep the temperature within the permissible limit.

### Repairing soldered joints

Apply a low voltage soldering iron (less than 24 V) to the lead(s) of the package, below the seating plane or not more than 2 mm above it. If the temperature of the soldering iron bit is less than 300 °C it may remain in contact for up to 10 seconds. If the bit temperature is between 300 and 400 °C, contact may be up to 5 seconds.

## DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

## LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.
