

## Product Description

Sirenza Microdevices' SGA-4386 is a high performance SiGe HBT MMIC Amplifier. A Darlington configuration featuring 1 micron emitters provides high  $F_T$  and excellent thermal performance. The heterojunction increases breakdown voltage and minimizes leakage current between junctions. Cancellation of emitter junction non-linearities results in higher suppression of intermodulation products. At 850 MHz and 45mA, the SGA-4386 typically provides +28.9 dBm output IP3, 17 dB of gain, and +15.3 dBm of 1dB compressed power using a single positive voltage supply. Only 2 DC-blocking capacitors, a bias resistor and an optional RF choke are required for operation.

## Basic Application Circuit

### Part Identification Marking

The part will be marked with an "A43" designator on the top surface of the package.

### Caution: ESD sensitive

Appropriate precautions in handling, packaging and testing devices must be observed.

## Recommended Bias Resistor Values for I<sub>D</sub>=45mA

$$R_{BIAS} = (V_S - V_D) / I_D$$

Supply Voltage (V <sub>S</sub> )	6 V	8 V	10 V	12 V
R <sub>BIAS</sub>	62 Ω	110 Ω	150 Ω	200 Ω

Note: R<sub>BIAS</sub> provides DC bias stability over temperature.

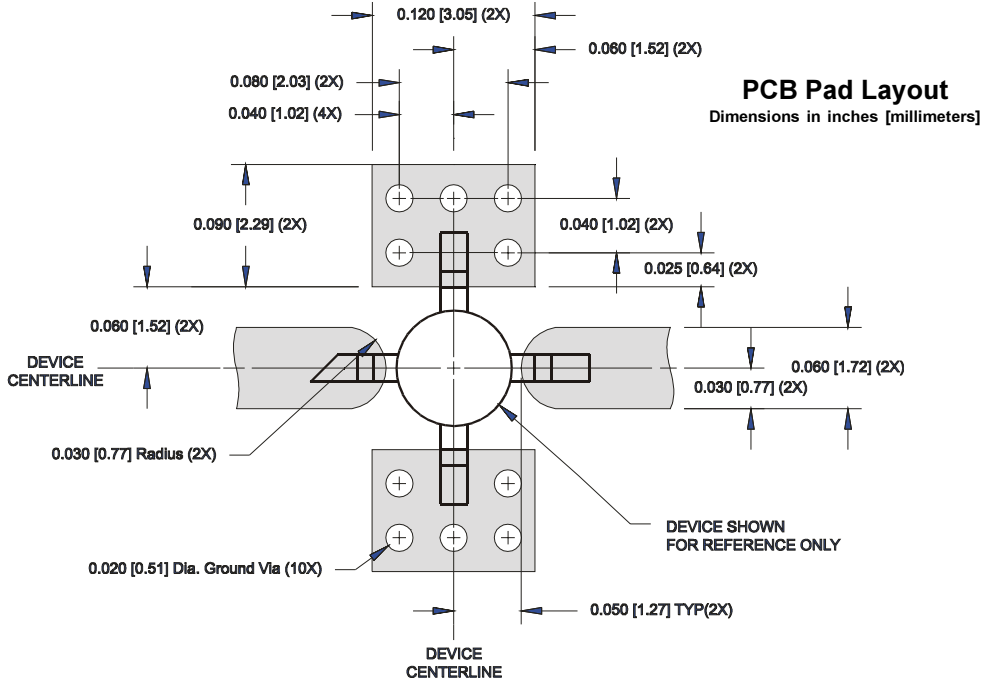

## Mounting Instructions

1. Use a large ground pad area under device pins 2 and 4 with many plated through-holes as shown.
2. We recommend 1 or 2 ounce copper. Measurements for this data sheet were made on a 31 mil thick FR-4 board with 1 ounce copper on both sides.

Pin #	Function	Description
1	RF IN	RF input pin. This pin requires the use of an external DC blocking capacitor chosen for the frequency of operation.
2, 4	GND	Connection to ground. Use via holes for best performance to reduce lead inductance as close to ground leads as possible.
3	RF OUT/BIAS	RF output and bias pin. DC voltage is present on this pin, therefore a DC blocking capacitor is necessary for proper operation.
