

## PROGRAMMABLE 27-BIT SERIAL-TO-PARALLEL RECEIVER

### FEATURES

- **Serial Interface Technology**
- **Compatible With FlatLink™ 3G Transmitters (E.g., SN65LVDS305 or SN65LVDS307)**
- **Supports Video Interfaces up to 24-Bit RGB Data and 3 Control Bits Received Over One SubLVDS Differential Data Line**
- **SubLVDS Differential Voltage Levels**
- **Up to 405-Mbps Data Throughput**
- **Three Operating Modes to Conserve Power**
  - Active mode QVGA: 17 mW
  - Typical Shutdown: 0.7  $\mu$ W
  - Typical Standby Mode: 67  $\mu$ W Typical
- **ESD Rating > 4 kV (HBM)**
- **Pixel-Clock Range of 4 MHz–15 MHz**
- **Failsafe on All CMOS Inputs**
- **Packaged in 4-mm  $\times$  4-mm MicroStar Junior™  $\mu$ BGA® With 0,5-mm Ball Pitch**
- **Very Low EMI**

### APPLICATIONS

- **Small Low-Emission Interface Between Graphics Controller and LCD Display**
- **Mobile Phones and Smart Phones**
- **Portable Multimedia Players**

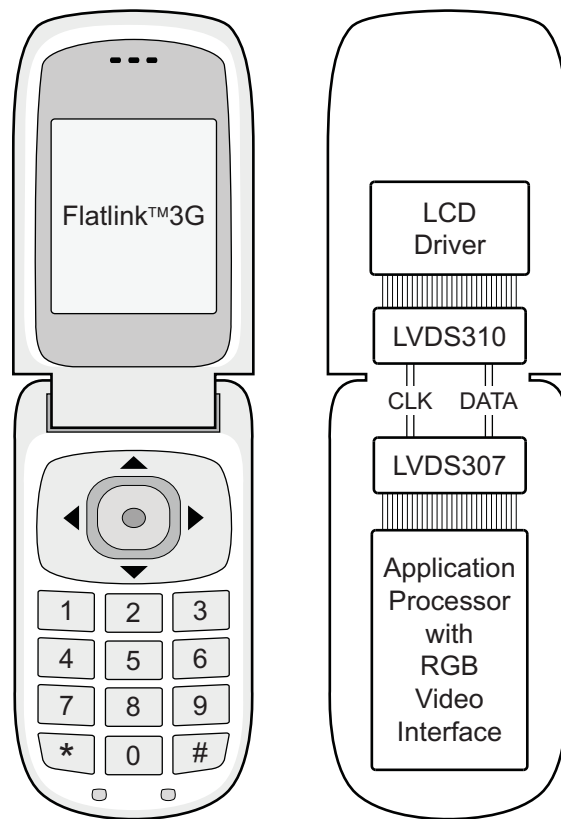

### DESCRIPTION

The SN65LVDS310 receiver deserializes FlatLink 3G-compliant serial input data to 27 parallel data outputs. The SN65LVDS310 receiver contains one shift register to load 30 bits from one serial input and latches the 24 pixel bits and 3 control bits out to the parallel CMOS outputs after checking the parity bit. If a parity error is detected, the data output bus disregards the newly received pixel. Instead, the last data word is held on the output bus for another clock cycle.

The serial data and clock are received via sub-low-voltage differential signalling (SubLVDS) lines. The SN65LVDS310 supports three operating power modes (shutdown, standby, and active) to conserve power.

When receiving, the PLL locks to the incoming clock, CLK, and generates an internal high-speed clock at the line rate of the data lines. The data is serially loaded into a shift register using the internal high-speed clock. The deserialized data is presented on the parallel output bus with a recreation of the pixel clock, PCLK, generated from the internal high-speed clock. If no input CLK signal is present, the output bus is held static with PCLK and DE held low, while all other parallel outputs are pulled high.

The F/S control input selects between a slow CMOS bus output rise time for best EMI and power consumption and a fast CMOS output for increased speed or higher-load designs.

M0056-04

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

FlatLink, MicroStar Junior are trademarks of Texas Instruments.  
 $\mu$ BGA is a registered trademark of Tessera, Inc.

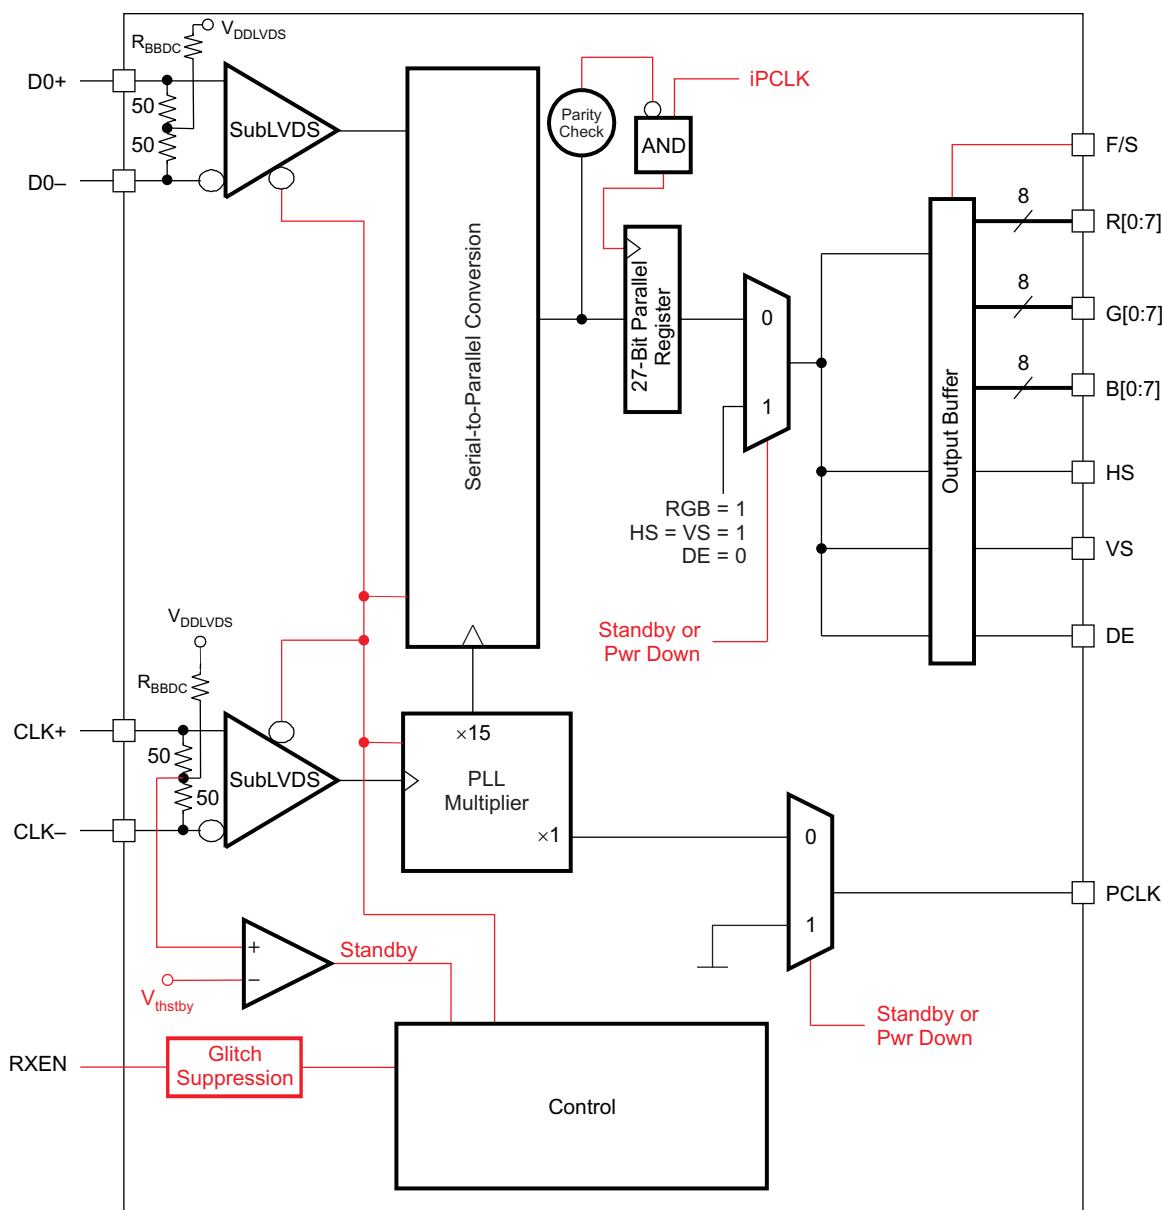

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## DESCRIPTION (CONTINUED)

The RXEN input can be used to put the SN65LVDS310 in a shutdown mode. The SN65LVDS310 enters an active standby mode if the common mode voltage of the CLK input becomes shifted to  $V_{DDLVS}$  (e.g., transmitter releases CLK output into high-impedance). This minimizes power consumption without the need of switching an external control pin. The SN65LVDS310 is characterized for operation over ambient air temperatures of  $-40^{\circ}\text{C}$  to  $85^{\circ}\text{C}$ . All CMOS and SubLVDS signals are 2-V tolerant with  $V_{DD} = 0\text{ V}$ . This feature allows powering up I/Os before  $V_{DD}$  is stabilized.

VDD <sub>PLLA</sub>		PLL analog supply voltage
GND <sub>PLLA</sub>		PLL analog GND
VDD <sub>PLLD</sub>		PLL digital supply voltage
GND <sub>PLLD</sub>		PLL digital GND

## FUNCTIONAL DESCRIPTION

### DESERIALIZATION MODE

The SN65LVDS310 receives payload data over a single SubLVDS data pair D0. The PLL locks to the SubLVDS clock input and internally multiplies the clock by a factor of 30. The internal high-speed clock is used to shift in the data payload on D0 and deserialize the data. Figure 1 illustrates the timing and the mapping of the data payload into the 30-bit frame. The internal high-speed clock is divided by a factor of 30 to recreate the pixel clock, and the data payload with the pixel clock is presented on the output bus. The reserved bits and parity bit are not output. The PLL can lock to a clock that is in the range of 4 MHz through 15 MHz.

Figure 1. Data and Clock Input

### POWER-DOWN MODES

The SN65LVDS310 receiver has two power-down modes to facilitate efficient power management.

#### Shutdown Mode

A low input signal on the RXEN pin puts the SN65LVDS310 into shutdown mode. This turns off most of the receiver circuitry, including the SubLVDS receivers, PLL, and deserializers. The SubLVDS differential-input resistance remains 100  $\Omega$ , and any input signal is ignored. All outputs hold a static output pattern:

$$R[0:7] = G[0:7] = B[0:7] = VS = HS = \text{high}; DE = PCLK = \text{low}.$$

The current draw in shutdown mode is nearly zero if the SubLVDS inputs are left open or pulled high.

#### Standby Mode

The SN65LVDS310 enters the standby mode when the SN65LVDS310 is not in shutdown mode but the SubLVDS clock-input common-mode voltage is above  $0.9 \times V_{DD_{LVDS}}$ . The CLK input incorporates pullup circuitry. This circuit shifts the SubLVDS clock-input common-mode voltage to  $V_{DD_{LVDS}}$  in the absence of an input signal. All circuitry except the SubLVDS clock-input standby monitor is shut down. The SN65LVDS310 also enters the standby mode when the input clock frequency on the CLK input is less than 500 kHz. The SubLVDS input resistance remains 100  $\Omega$ , and any input signal on the data inputs D0+ and D0- is ignored. All outputs hold a static output pattern:

$$R[0:7] = G[0:7] = B[0:7] = VS = HS = \text{high}; DE = PCLK = \text{low}.$$

The current drawn in standby mode is very low.

### ACTIVE MODES

A high input signal on RXEN combined with a CLK input signal switching faster than 3 MHz and  $V_{ICM}$  smaller than 1.3 V forces the SN65LVDS310 into the active mode. Current consumption in the active mode depends on operating frequency and the number of data transitions in the data payload. CLK-input frequencies between 3 MHz and 4 MHz activate the device, but proper PLL functionality is not assured.

#### Acquire Mode (PLL Approaches Lock)

When the SN65LVDS310 is enabled and a SubLVDS clock input is present, the PLL pursues lock to the input clock. While the PLL pursues lock, the output data bus holds a static output pattern:

$$R[0:7] = G[0:7] = B[0:7] = VS = HS = \text{high}; DE = PCLK = \text{low}.$$

## FUNCTIONAL DESCRIPTION (continued)

For proper device operation, the pixel clock frequency must fall within the valid  $f_{PCLK}$  range specified under recommended operating conditions. If the pixel clock frequency is higher than 3 MHz but lower than  $f_{PCLK}(\text{MIN})$ , the SN65LVDS310 PLL is enabled. Under such conditions, it is possible for the PLL to lock temporarily to the pixel clock, causing the PLL monitor to release the device into the active receive mode. If this happens, the PLL may or may not be properly locked to the pixel clock input, potentially causing data errors, frequency oscillation, and PLL deadlock (loss of VCO oscillation).

### Receive Mode

After the PLL achieves lock, the device enters the normal receive mode. The output data bus presents the deserialized data. The PCLK output pin outputs the recovered pixel clock.

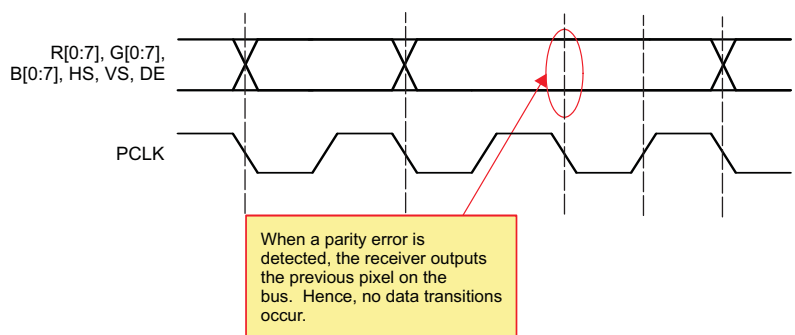

### PARITY ERROR DETECTION AND HANDLING

The SN65LVDS310 receiver performs error checking on the basis of a parity bit that is transmitted across the LVDS interface from the transmitting device. Once the SN65LVDS310 detects the presence of the clock and the PLL has locked onto PCLK, then the parity is checked. Parity-error detection ensures detection of all single-bit errors in one pixel and 50% of all multibit errors.

The parity bit covers the 27-bit data payload consisting of 24 bits of pixel data plus VS, HS, and DE. Odd-parity bit signalling is used. If the sum of the 27 data bits and the parity bit is an odd number, the receive data are assumed to be valid. If the sum is an even number, parity error is declared.

If a parity error is detected, then the data on that PCLK cycle is not output. Instead, the last valid data from a previous PCLK cycle is repeated on the output bus. This is to prevent any bit error that occurs on the LVDS link from causing perturbations in VS, HS, or DE that might be visually disruptive to a display.

The reserved bits are not covered in the parity calculations.

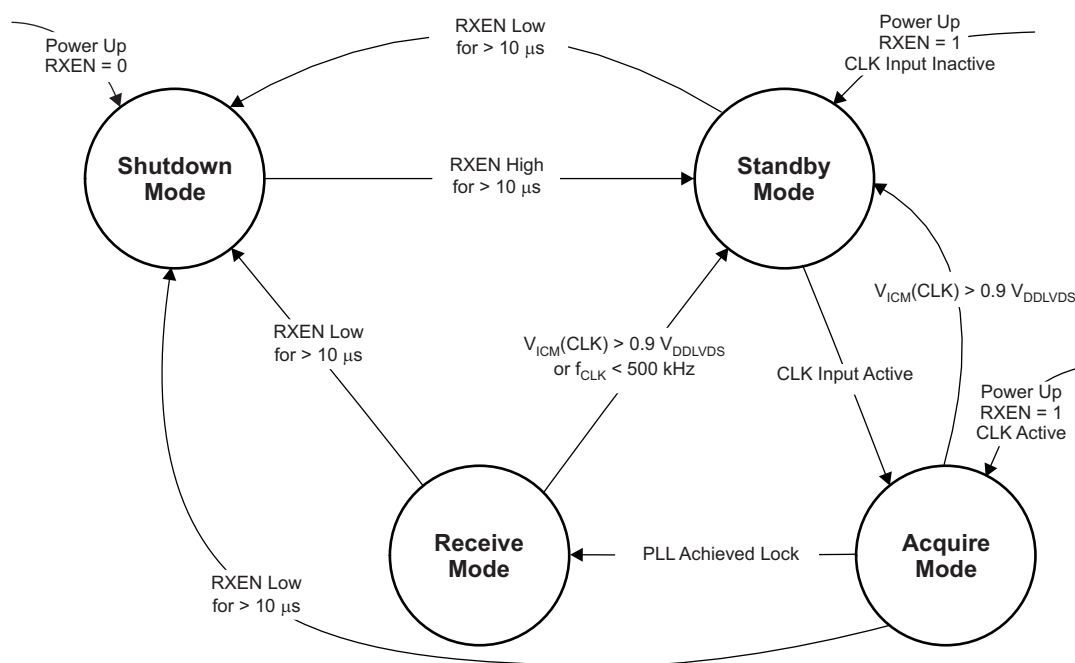

T0163-02

Figure 2. Output Response When Parity Error Is Detected

## FUNCTIONAL DESCRIPTION (continued)

### STATUS-DETECT AND OPERATING-MODES FLOW DIAGRAM

The SN65LVDS310 switches between the power-saving and active modes in the following way:

F0017-01

Figure 3. Operating Modes Flow Diagram

Table 3. Status Detect and Operating Modes Descriptions

MODE	CHARACTERISTICS	CONDITIONS
Shutdown mode	Least amount of power consumption (most circuitry turned off); all outputs held static: $R[0:7] = G[0:7] = B[0:7] = VS = HS = \text{high}$ ; $DE = PCLK = \text{low}$	$RXEN$ is set low for longer than $10\ \mu\text{s}$ . <sup>(1)(2)</sup>
Standby mode	Low power consumption (standby monitor circuit active; PLL is shut down to conserve power); All outputs held static: $R[0:7] = G[0:7] = B[0:7] = VS = HS = \text{high}$ ; $DE = PCLK = \text{low}$	$RXEN$ is high for longer than $10\ \mu\text{s}$ and $CLK$ inputs are common-mode, $V_{ICM(CLK)}$ is above $0.9 \times V_{DDLVDs}$ , or $CLK$ inputs are floating <sup>(2)</sup>
Acquire mode	PLL pursues lock; all outputs held static: $R[0:7] = G[0:7] = B[0:7] = VS = HS = \text{high}$ ; $DE = PCLK = \text{low}$	$RXEN$ is high; $CLK$ input monitor detected clock input common mode and woke up receiver from standby mode.
Receive mode	Data transfer (normal operation); receiver deserializes data and provides data on parallel output	$RXEN$ is high and PLL is locked to incoming clock.

(1) In shutdown mode, all SN65LVDS310 internal switching circuits (e.g., PLL, serializer, etc.) are turned off to minimize power consumption. The input stage of any input pin remains active.

(2) Leaving CMOS control inputs unconnected can cause random noise to toggle the input stage and potentially harm the device. All CMOS inputs must be tied to a valid logic level,  $V_{IL}$  or  $V_{IH}$ , during shutdown or standby mode. Exceptions are the SubLVDS inputs  $CLK$  and  $D0$ , which can be left unconnected while not in use.

**Table 4. Operating Mode Transitions**

MODE TRANSITION	USE CASE	TRANSITION SPECIFICS
Shutdown → standby	Drive RXEN high to enable receiver.	<ol style="list-style-type: none"> <li>1. RXEN high &gt; 10 <math>\mu</math>s</li> <li>2. <b>R[7:0], G[7:0], B[7:0], VS, HS, PCLK</b>						
$C_L$	Output load capacitance			10		pF

(1) Unused single-ended inputs must be held high or low to prevent them from floating.

(2) PCLK input frequencies lower than 500 kHz force the SN65LVDS310 into standby mode. Input frequencies between 500 kHz and 3 MHz may or may not activate the SN65LVDS310. Input frequencies beyond 3 MHz activate the SN65LVDS310. Input frequencies between 500 kHz and 4 MHz are not recommended, and can cause PLL malfunction.

## DEVICE ELECTRICAL CHARACTERISTICS

over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
$I_{DD}$ RMS supply current	Alternating 1010 test pattern (see Table 7); all CMOS outputs terminated with 10 pF; F/S and RXEN at VDD; $V_{IH} = V_{DD}$ , $V_{IL} = 0$ V; $V_{DD} = V_{DD_{PLLA}} = V_{DD_{PLLD}} = V_{DD_{LVDS}}$	$f_{PCLK} = 4$ MHz	9.8	14	mA

(1) All typical values are at 25°C and with 1.8-V supply, unless otherwise noted.

(2) t<sub>ri/f</sub> depends on the F/S setting and the capacitive load connected to each output. Some application information of how to calculate t<sub>ri/f</sub> based on the output load and how to estimate the timing budget to interconnect to an LCD driver are provided in the application section near the end of this data sheet.

(3) The output rise and fall times are optimized for an output load of 10 pF. The rise and fall times can be adjusted by changing the output load capacitance.

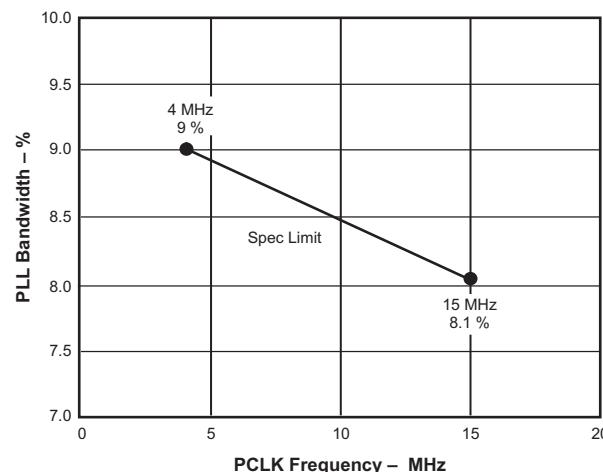

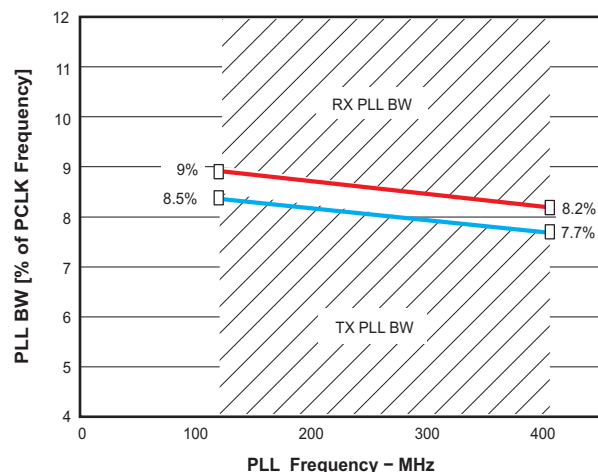

(4) The RXEN input incorporates glitch-suppression logic to disregard short input pulses. t<sub>GS</sub> is the duration of either a high-to-low or low-to-high transition that is suppressed.

## SWITCHING CHARACTERISTICS (continued)

over recommended operating conditions (unless otherwise noted)

PARAMETER	TEST CONDITIONS	MIN	TYP <sup>(1)</sup>	MAX	UNIT
$f_{BW}$	PLL bandwidth <sup>(5)</sup>	0.087 $f_{PCLK}$			MHz

- (5) When using the SN65LVDS310 receiver in conjunction with the SN65LVDS307 transmitter in one link, the PLL bandwidth of the SN65LVDS310 receiver always exceeds the bandwidth of the SN65LVDS307 transmit PLL. This ensures stable PLL tracking under all operating conditions and maximizes the receiver skew margin.

G001

Figure 4. SN65LVDS310 PLL Bandwidth (Also Showing the SN65LVDS307 PLL Bandwidth)

## TIMING CHARACTERISTICS

PARAMETER	TEST CONDITIONS	MIN	MAX	UNIT
$t_{RSKMx}$ (1)(2)	$x = 0.29$ , $f_{PCLK} = 15$ MHz; RXEN at VDD, $V_{IH} = VDD$ , $V_{IL} = GND$ , $R_L = 100 \Omega$ , test setup as in Figure 6, test pattern as in Table 9	$f_{CLK} = 15$ MHz <sup>(4)</sup>		ps
		$f_{CLK} = 4$ MHz to 15 MHz <sup>(5)</sup>	$\frac{1}{2 \cdot 30 \cdot f_{CLK}} - 480$ ps	

- (1) Receiver input skew margin ( $t_{RSKM}$ ) is the timing margin available for transmitter output pulse position ( $t_{PPOS}$ ), interconnect skew, and interconnect inter-symbol interference.  $t_{RSKM}$  represents the remainder of the serial bit time not taken up by the receiver strobe uncertainty.  $t_{RSKM}$  assumes a bit error rate better than  $10^{-12}$ .
- (2)  $t_{RSKM}$  is inversely proportional to the internal setup and hold time uncertainty, ISI, and duty-cycle distortion from the front-end receiver, the skew mismatch between CLK and data D0, as well as the PLL cycle-to-cycle jitter.
- (3) This includes the receiver internal setup and hold time uncertainty, all PLL-related high-frequency random and deterministic jitter components that impact the jitter budget, ISI and duty-cycle distortion from the front-end receiver, and the skew between CLK and data D0; the pulse position minimum/maximum variation is given with a bit error rate target of  $10^{-12}$ ; measurements of the total jitter are taken over  $>10^{12}$  samples.
- (4) The minimum and maximum limits are based on statistical analysis of the device performance over process, voltage, and temperature ranges.
- (5) These minimum and maximum limits are simulated only.

## MAXIMUM POWER-CONSUMPTION TEST PATTERNS

The maximum (or worst-case) power consumption of the SN65LVDS310 is tested using the two different test patterns shown in [Table 7](#) and [Table 8](#). Test patterns consist of 16 30-bit transmit words. The pattern repeats itself throughout the entire measurement. It is assumed that every possible transmit code on RGB inputs has the same probability to occur during typical device operation.

## OUTPUT SKEW PULSE POSITION and JITTER PERFORMANCE

The test pattern of [Table 9](#) is used to measure the output skew pulse position and the jitter performance of the SN65LVDS310. The jitter test pattern stresses the interconnect, particularly to test for ISI, using very long run-lengths of consecutive bits, and incorporating very high and low data rates, maximizing switching noise. Each pattern is self-repeating for the duration of the test.

## APPLICATION INFORMATION

### PREVENTING INCREASED LEAKAGE CURRENTS IN CONTROL INPUTS

A floating (left open) CMOS input allows leakage currents to flow from VDD to GND. Do not leave any CMOS input unconnected or floating. Every input must be connected to a valid logic level,  $V_{IH}$  or  $V_{OL}$ , while power is supplied to VDD. This also minimizes the power consumption of standby and power-down modes.

### POWER-SUPPLY DESIGN RECOMMENDATION

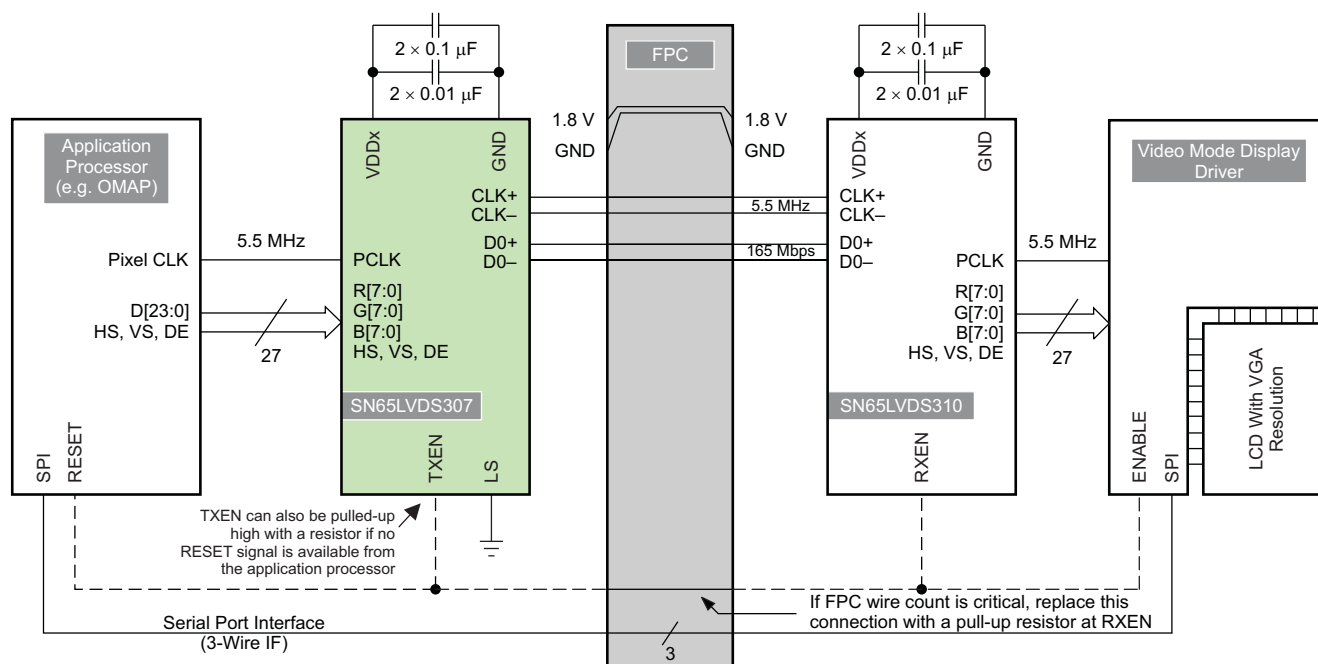

For a multilayer PCB, it is recommended to keep one common GND layer underneath the device and connect all ground terminals directly to this plane.

### SN65LVDS310 DECOUPLING RECOMMENDATION

The SN65LVDS310 was designed to operate reliably in a constricted environment with other digital switching ICs. In cell phone designs, the SN65LVDS310 often shares a power supply with various other ICs. The SN65LVDS310 can operate with power-supply noise as specified in the <sup>(1)</sup> To minimize the power-supply noise floor, provide good decoupling near the SN65LVDS310 power pins. The use of four ceramic capacitors (two 0.01- $\mu$ F and two 0.1- $\mu$ F) provides good performance. At the very least, it is recommended to install one 0.1- $\mu$ F and one 0.01- $\mu$ F capacitor near the SN65LVDS310. To avoid large current loops and trace inductance, the trace length between the decoupling capacitors and IC power input pins must be minimized. Placing the capacitor underneath the SN65LVDS310 on the bottom of the PCB is often a good choice.

### VGA APPLICATION

Figure 27 shows a possible implementation of a  $640 \times 480$  VGA display. The SN65LVDS307 interfaces to the SN65LVDS310, which is the corresponding receiver device, to deserialize the data and drive the display driver. The pixel-clock rate of 5.5 MHz assumes ~10% blanking overhead and a 60-Hz display refresh rate. The application assumes 24-bit color resolution. Also shown is how the application processor provides a power-down (reset) signal for both the serializer and the display driver. The signal count over the flexible printed circuit board (FPC) could be further decreased by using the automatic standby detection feature of the SN65LVDS310 and pulling RXEN permanently high.

B0178-04

Figure 27. Typical VGA Display Application

(1) Unused single-ended inputs must be held high or low to prevent them from floating.

## APPLICATION INFORMATION (continued)

### TYPICAL APPLICATION FREQUENCIES

The SN65LVDS310 supports pixel clock frequencies from 4 MHz to 15 MHz. Table 10 provides a few typical display resolution examples. The blanking overhead is assumed to be 20%. Often, blanking overhead is smaller, resulting in a lower data rate.

**Table 10. Typical Application Data Rates and Serial Lane Usage**

Display Screen Resolution	Visible Pixel Count	Blanking Overhead	Display Refresh Rate [Hz]	Pixel Clock Frequency on CLK [MHz]	Serial Data Rate [Mbps]
240 × 320 (QVGA)	76,800	20%	60	5.5	166
640 × 200	128,000			9.2	276
352 × 416 (CIF+)	146,432			10.5	316
352 × 440	154,880			11.2	335
320 × 480 (HVGA)	153,600		30	5.5	166
320 × 480 (HVGA)	153,600		60	11.1	332
800 × 250	200,000			14.4	432
640 × 320	204,800			14.7	442
640 × 480 (VGA)	307,200		30	11.1	332

### CALCULATION EXAMPLE: HVGA DISPLAY

The following calculation shows an example for a half-VGA display with the following parameters:

Display resolution:	480 × 320
Frame refresh rate:	58.4 Hz
Vertical visible pixels:	320 lines
Vertical front porch:	10 lines
Vertical sync:	5 lines
Vertical back porch:	3 lines
Horizontal visible pixels:	480 columns
Horizontal front porch:	20 columns
Horizontal sync:	5 columns
Horizontal back porch:	3 columns

**Figure 28. HVGA Display**

*Calculation of the total number of pixel and blanking overhead:*

Visible area pixel count:	$480 \times 320 = 153,600$ pixels
Total frame pixel count:	$(480 + 20 + 5 + 3) \times (320 + 10 + 5 + 3) = 171,704$ pixels
Blanking overhead:	$(171,704 - 153,600) \div 153,600 \approx 11.8\%$

*The application requires the following serial-link parameters:*

Pixel clock frequency:	$171,704 \times 58.4 \text{ Hz} = 10 \text{ MHz}$
Serial data rate:	$10 \text{ MHz} \times 30 \text{ bits} = 300 \text{ Mbps}$

## HOW TO DETERMINE INTERCONNECT SKEW AND JITTER BUDGET

Designing a reliable data link requires examining the interconnect skew and jitter budget. The sum of all transmitter, PCB, connector, FPC, and receiver uncertainties must be smaller than the available serial bit time. The highest pixel clock frequency defines the available serial bit time. The transmitter timing uncertainty is defined by  $t_{PPOS}$  in the transmitter data sheet. For a bit-error-rate target of  $\leq 10^{-12}$ , the measurement duration for  $t_{PPOS}$  is  $\geq 10^{12}$ . The SN65LVDS310 receiver can tolerate a maximum timing uncertainty defined by  $t_{RSKM}$ . The interconnect budget is calculated by:

$$t_{\text{interconnect}} = t_{\text{RSKM}} - t_{\text{PPOS}}$$

### Example:

$f_{\text{PCLK}}(\text{max}) = 11 \text{ MHz}$  (HVGA display resolution, 60 Hz)

$t_{\text{PPOS}}(\text{SN65LVDS305}) = 330 \text{ ps}$

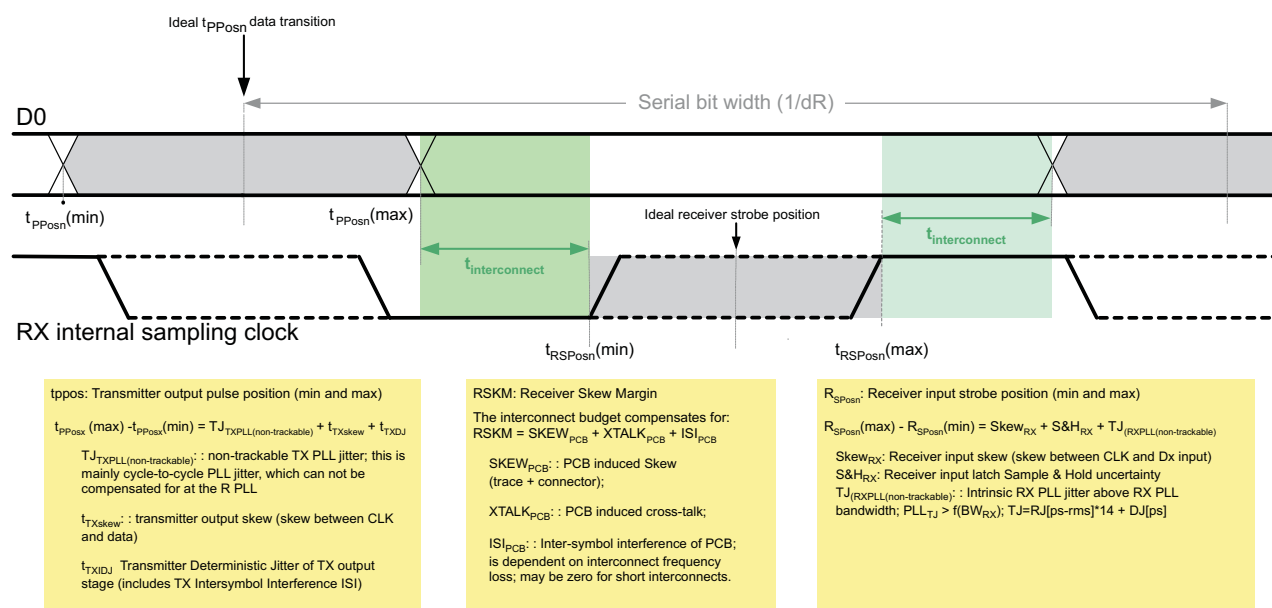

Target bit error rate:  $10^{-12}$

$t_{\text{RSKM}}(\text{SN65LVDS310}) = 1/(2 \times 30 \times f_{\text{PCLK}}) - 480 \text{ ps} = 1035 \text{ ps}$

The interconnect budget for cable skew and ISI must be smaller than:

$$t_{\text{interconnect}} = t_{\text{RSKM}} - t_{\text{PPOS}} = 1035 \text{ ps} - 330 \text{ ps} = 705 \text{ ps}$$

$$t_{\text{interconnect}} = t_{\text{RSKM}} - t_{\text{PPOS}}$$

T0165-04

**Figure 29. Jitter Budget**

## F/S-PIN SETTING AND CONNECTING THE SN65LVDS310 TO AN LCD DRIVER

### NOTE:

**Receiver PLL tracking:** To maximize the design margin for the interconnect, good RX PLL tracking of the TX PLL is important. FlatLink 3G connection requires the RX PLL to have a bandwidth higher than the bandwidth of the TX PLL. The SN65LVDS310 PLL design is optimized to track the SN65LVDS307 PLL particularly well, thus providing a very large receiver skew margin. A FlatLink 3G-compliant link must provide at least  $\pm 225 \text{ ppm}$  of receiver skew margin for the interconnect.

It is important to understand the tradeoff between power consumption, EMI, and maximum speed when selecting the F/S signal. It is beneficial to choose the slowest rise time possible to minimize EMI and power consumption. Unfortunately, a slower rise time also reduces the timing margin left for the LCD driver. Hence, it is necessary to calculate the timing margin to select the correct F/S pin setting.

The output rise time depends on the output driver strength and the output load. An LCD driver typical capacitive load is assumed with ~10 pF. The higher the capacitive load, the slower is the rise time. Rise time of the SN65LVDS310 is measured as the time duration it takes the output voltage to rise from 20% of VDD to 80% of VDD, and fall time is defined as the time for the output voltage to transition from 80% of VDD to 20% of VDD.

The rise time of the output stage is fixed and does not adjust to the pixel frequency. Only changing the F/S setting changes the output rise time. Due to the short bit time at very fast pixel clock speeds and the real capacitive load of the display driver, the output amplitude might not reach VDD and GND saturation fully. To ensure sufficient signal swing and verify the design margin, it is necessary to determine that the output amplitude under any circumstance reaches the display driver's input stage logic threshold (usually 30% and 70% of VDD).

## HOW TO DETERMINE THE LCD DRIVER TIMING MARGIN

To determine the timing margin, it is necessary to specify the frequency of operation, identify the setup and hold times of the LCD driver, and specify the output load of the SN65LVDS310 as a combination of the LCD driver input parasitics plus any capacitance caused by the connecting PCB trace. Furthermore, the setting of pin F/S and the SN65LVDS310 output skew impact the margin. The total remaining design margin calculates as follows:

$$t_{DM} = \frac{1}{2 \times f_{PCLK}} - t_{DUTP(max\_error)} - \frac{t_{rise(max)} \times C_{LOAD}}{10 \text{ pF}} - |t_{OSK}| \quad (2)$$

where:

$t_{DM}$  – design margin

$f_{PCLK}$  – pixel clock frequency

$t_{DUTP(max\_error)}$  – maximum duty cycle error

$t_{rise(max)}$  – maximum rise or fall time; see  $t_{r/f}$  under switching characteristics

$C_L$  – parasitic capacitance (sum of LCD driver input parasitics + connecting PCB trace)

$t_{skew}$  – clock-to-data output skew, SN65LVDS310

### Example:

At a pixel clock frequency of 11 MHz (HVGA), and an assumed LCD driver load of 15 pF, the remaining timing margin is:

$$t_{DUTP(max\_error)} = \frac{|t_{DUTP(max)} - 50\%|}{100\%} \times t_{PCLK} = \frac{5\%}{100\%} \times \frac{1}{11 \text{ MHz}} = 4.5 \text{ ns}$$

$$t_{DM} = \frac{1}{2 \times 5.5 \text{ MHz}} - 9 \text{ ns} - \frac{16 \text{ ns}_{(F/S=GND)} \times 15 \text{ pF}}{10 \text{ pF}} - 500 \text{ ps} = 16 \text{ ns}$$

As long as the setup and hold times of the LCD driver are BOTJ less than 16 ns, the timing budget is met sufficiently.

## PACKAGING INFORMATION

Orderable Device	Status <sup>(1)</sup>	Package Type	Package Drawing	Pins	Package Qty	Eco Plan <sup>(2)</sup>	Lead/Ball Finish	MSL Peak Temp <sup>(3)</sup>
SN65LVDS310ZQCR	ACTIVE	BGA MI CROSTAR JUNIOR	ZQC	48	2500	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR
SN65LVDS310ZQCT	ACTIVE	BGA MI CROSTAR JUNIOR	ZQC	48	250	Green (RoHS & no Sb/Br)	SNAGCU	Level-3-260C-168 HR

<sup>(1)</sup> The marketing status values are defined as follows:

**ACTIVE:** Product device recommended for new designs.

**LIFEBUY:** TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.

**NRND:** Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.

**PREVIEW:** Device has been announced but is not in production. Samples may or may not be available.

**OBSELETE:** TI has discontinued the production of the device.

<sup>(2)</sup> Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS), Pb-Free (RoHS Exempt), or Green (RoHS & no Sb/Br) - please check <http://www.ti.com/productcontent> for the latest availability information and additional product content details.

**TBD:** The Pb-Free/Green conversion plan has not been defined.

**Pb-Free (RoHS):** TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.

**Pb-Free (RoHS Exempt):** This component has a RoHS exemption for either 1) lead-based flip-chip solder bumps used between the die and package, or 2) lead-based die adhesive used between the die and leadframe. The component is otherwise considered Pb-Free (RoHS compatible) as defined above.

**Green (RoHS & no Sb/Br):** TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

<sup>(3)</sup> MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.

TI products are not authorized for use in safety-critical applications (such as life support) where a failure of the TI product would reasonably be expected to cause severe personal injury or death, unless officers of the parties have executed an agreement specifically governing such use. Buyers represent that they have all necessary expertise in the safety and regulatory ramifications of their applications, and acknowledge and agree that they are solely responsible for all legal, regulatory and safety-related requirements concerning their products and any use of TI products in such safety-critical applications, notwithstanding any applications-related information or support that may be provided by TI. Further, Buyers must fully indemnify TI and its representatives against any damages arising out of the use of TI products in such safety-critical applications.

TI products are neither designed nor intended for use in military/aerospace applications or environments unless the TI products are specifically designated by TI as military-grade or "enhanced plastic." Only products designated by TI as military-grade meet military specifications. Buyers acknowledge and agree that any such use of TI products which TI has not designated as military-grade is solely at the Buyer's risk, and that they are solely responsible for compliance with all legal and regulatory requirements in connection with such use.

TI products are neither designed nor intended for use in automotive applications or environments unless the specific TI products are designated by TI as compliant with ISO/TS 16949 requirements. Buyers acknowledge and agree that, if they use any non-designated products in automotive applications, TI will not be responsible for any failure to meet such requirements.
