

# SOLOMON SYSTECH SEMICONDUCTOR TECHNICAL DATA

## Product Preview LCD Segment / Common Driver with Controller CMOS

SSD1812 is a single-chip CMOS LCD driver with controller for liquid crystal dot-matrix graphic display system. It consists of 187 high voltage driving output pins for driving 132 Segments, 54 Commons and 1 Icon Driving-Common.

SSD1812 displays data directly from its internal 132 X 65 bits Graphic Display Data RAM (GDDRAM). Data/Commands are sent from general MCU through a software selectable 6800-/8080-series compatible Parallel Interface or Serial Peripheral Interface.

SSD1812 embeds a DC-DC Converter, an On-Chip Bias Divider and an On-Chip Oscillator which reduce the number of external components. With the special design on minimizing power consumption and die/package layout, SSD1812 is suitable for any portable battery-driven applications requiring a long operation period and a compact size.

- Single Supply Operation, 1.8 V - 3.5V
- Minimum -12.0V LCD Driving Output Voltage
- Low Current Sleep Mode
- On-Chip Voltage Generator / External Power Supply
- 2X / 3X / 4X On-Chip DC-DC Converter
- On-Chip Oscillator
- Programmable Multiplex ratio [1Mux - 55Mux]
- On-Chip Smart Bias Divider
- Programmable 1/4, 1/5, 1/6, 1/7, 1/8 and 1/9 bias ratio
- 8-bit 6800-series Parallel Interface, 8-bit 8080-series Parallel Interface and Serial Peripheral Interface
- On-Chip 132 x 65 Graphic Display Data RAM
- Re-mapping of Row and Column Drivers
- Vertical Scrolling
- Display Offset Control
- RAM Page Blinking
- 64 Level Internal Contrast Control
- External Contrast Control
- Selectable LCD Driving Voltage Temperature Coefficients (8 settings)
- Available in Gold Bump Die and Standard TAB (Tape Automated Bonding) Package

### Block Diagram

**+** Gold Bump Alignment Mark  
 This alignment mark contains gold nump for IC bumping process alignment and IC identifications. No conductive tracks should be laid underneath this mark to avoid short circuit.

**Note:**  
 Coordinates and Size of all alignment marks are in unit um and w.r.t. center of the chip.

PIN #1  
 Die Size: 10.977mm X 1.912mm  
 Die Thickness: 533 +/-25um  
 Bump Pitch: 76.2 um [Min]  
 Bump Height: Nominal 18um

**MAXIMUM RATINGS\*** (Voltages Referenced to  $V_{SS}$ ,  $T_A=25^\circ\text{C}$ )

Symbol	Parameter	Value	Unit
$V_{DD}$	Supply Voltage	-0.3 to +4.0	V
$V_{EE}$		-4.0 to -12.0	V
$V_{in}$	Input Voltage	$V_{SS}-0.3$ to $V_{DD}+0.3$	V
I	Current Drain Per Pin Excluding $V_{DD}$ and $V_{SS}$	25	mA
$T_A$	Operating Temperature	-30 to +85	$^\circ\text{C}$
$T_{stg}$	Storage Temperature Range	-65 to +150	$^\circ\text{C}$

\* Maximum Ratings are those values beyond which damage to the device may occur. Functional operation should be restricted to the limits in the Electrical Characteristics tables or Pin Description section.

This device contains circuitry to protect the inputs against damage due to high static voltages or electric fields; however, it is advised that normal precautions to be taken to avoid application of any voltage higher than maximum rated voltages to this high impedance circuit. For proper operation it is recommended that  $V_{in}$  and  $V_{out}$  be constrained to the range  $V_{SS} < \text{or} = (V_{in} \text{ or } V_{out}) < \text{or} = V_{DD}$ . Reliability of operation is enhanced if unused input are connected to an appropriate logic voltage level (e.g., either  $V_{SS}$  or  $V_{DD}$ ). Unused outputs must be left open. This device may be light sensitive. Caution should be taken to avoid exposure of this device to any light source during normal operation. This device is not radiation protected.

**ELECTRICAL CHARACTERISTICS** (Voltage Referenced to  $V_{SS}$ ,  $V_{DD}=1.8$  to  $3.5\text{V}$ ,  $T_A=25^\circ\text{C}$ ; unless otherwise specified.)

## PIN DESCRIPTIONS

### $\overline{M/S}$

This pin is master/slave mode selection input. When this pin is pulled high, master mode is selected and CL, M, MSTAT and  $\overline{DOF}$  will be output to slave devices. When pulled low, slave mode is selected. CL, M, DOF are required to be input from master device while MSTAT is high impedance.

### M

This pin is the frame signal input/output. In master mode, the pin supplies frame signal to slave devices while in slave mode, the pin receives frame signal from the master device.

### MSTAT

This pin is used together with M in master operation for static drive output. It becomes high impedance in slave mode operation.

### CL

This pin is the display clock input/output. In master mode, the pin supplies display clock signal to slave devices while in slave mode, the pin receives display clock signal from the master device.

### $\overline{DOF}$

This pin is LCD blanking control input/output. In master mode, the pin supplies on/off signal to slave devices. In slave mode, the pin receives on/off signal from the master device.

### CLS

This pin is a internal clock enable input pin. When this pin is high, the internal clock is enabled. The internal clock will be disabled when it is low, an external clock should be input to CL pin.

### RES

This pin is reset signal input. When the pin is low, initialization of the chip is executed.

### $\overline{P/S}$

This pin is serial/parallel interface select input. When  $\overline{P/S}$  is high, parallel mode is selected and when  $\overline{P/S}$  is low, serial mode is selected. In serial mode, only write operation is allowed.

### CS1, CS2

These pin are chip select inputs. The chip is enabled for data operation only when  $\overline{CS1}$  is low and CS2 is high.

### C68/80

This pin is microprocessor interface select input. When the pin is high, 6800 series interface is selected and when the pin is low, 8080 series interface is selected.

### D<sub>0</sub>-D<sub>7</sub>

These pins are 8-bit bi-directional data bus to be connected to the microprocessor's data bus. When serial mode is selected, D<sub>7</sub> is the serial data input SDA and D<sub>6</sub> is the serial clock input SCK.

### $\overline{D/C}$

This pin is control/display data input control flag. When the pin is high, the data on D<sub>0</sub>-D<sub>7</sub> is display data. When the pin is low, the data on D<sub>0</sub>-D<sub>7</sub> is control data.

### $\overline{R/W(WR)}$

This pin is microprocessor interface signal. When interfacing to an 6800-series microprocessor, the signal indicates read mode when high and write mode when low. When interfacing to an 8080-microprocessor, a data write operation is initiated when  $\overline{R/W(WR)}$  is low and the chip is selected.

### $\overline{E(RD)}$

This pin is microprocessor interface signal. When interfacing to an 6800-series microprocessor, a data operation is initiated when  $\overline{E(RD)}$  is high and the chip is selected. When interfacing to an 8080-microprocessor, a data read operation is initiated when  $\overline{E(RD)}$  is low and the chip is selected.

### V<sub>DD</sub>

Power supply pin.

### V<sub>SS</sub>

Ground.

### V<sub>SS1</sub>

Reference voltage input for internal DC-DC converter. The voltage of generated VEE equals to the multiple factor (2X, 3X or 4X) times the potential different between this pin, V<sub>SS1</sub>, and V<sub>DD</sub>. All generated voltage is referenced to V<sub>DD</sub>.

Note: voltage at this input pin must less than or equal to V<sub>SS</sub>.

### V<sub>EE</sub>

This is the most negative voltage supply pin of the chip. It can be supplied externally or generated by the internal DC-DC converter.

When using internal DC-DC converter as generator, voltage at this pin is for internal reference only. It CANNOT be used for driving external circuitries.

### C<sub>3N</sub>, C<sub>1P</sub>, C<sub>1N</sub>, C<sub>2P</sub> and C<sub>2N</sub>

When internal DC-DC voltage converter is used, external capacitor(s) is/are connected among these pins.

### V<sub>L6</sub>

This pin is the most negative LCD driving voltage. It can be supplied externally or generated by the internal regulator.

### V<sub>F</sub>

This pin is an input of the internal voltage regulator. When internal regulator is used to generate V<sub>L6</sub>, external resistors are connected between V<sub>DD</sub> and V<sub>F</sub>, and V<sub>F</sub> and V<sub>L6</sub>, respectively (see application circuit).

### V<sub>FS</sub>

This pin is an input to provide an external voltage reference for the internal voltage regulator. It is only enabled in External Input chip options.

### IRS

This pin is an input pin to enable the internal resistors network for the voltage regulator when IRS is high. When it is low, the external resistors R1/R2 should be connected to VL6 and VF.

### HPM

This pin is an input pin to enable the high power current mode when it is low. The contrast curves in High Power Mode will be different to Normal Mode. Details of the High Power Mode Contrast curve is TBD.

### V<sub>L2</sub>, V<sub>L3</sub>, V<sub>L4</sub> and V<sub>L5</sub> (Voltages referenced to V<sub>DD</sub>)

LCD driving voltages. They can be supplied externally or generated by the internal smart bias divider. They have the following relationship:

$$V_{DD} > V_{L2} > V_{L3} > V_{L4} > V_{L5} > V_{L6}$$

	1:6 bias	1:8 bias
V <sub>L2</sub>	1/6*V <sub>L6</sub>	1/8*V <sub>L6</sub>
V <sub>L3</sub>	2/6*V <sub>L6</sub>	2/8*V <sub>L6</sub>
V <sub>L4</sub>	4/6*V <sub>L6</sub>	6/8*V <sub>L6</sub>
V <sub>L5</sub>	5/6*V <sub>L6</sub>	7/8*V <sub>L6</sub>

### ROW0 - ROW63

These pins provide the row driving signal COM0 - COM53 to the LCD panel. See Table.1 about the COM signal mapping in different multiplex ratio N.

### ICONS

This pin is the special icons line.

### SEG0 - SEG131

These pins provide the LCD column driving signal. Their voltage level is V<sub>DD</sub> during sleep mode and standby mode.

# OPERATION OF LIQUID CRYSTAL DISPLAY DRIVER

## Description of Block Diagram Module

### Command Decoder and Command Interface

This module determines whether the input data is interpreted as data or command. Data is directed to this module based upon the input of the D/C pin. If D/C is high, data is written to Graphic Display Data RAM (GDDDRAM). If D/C is low, the input at D<sub>0</sub>-D<sub>7</sub> is interpreted as a Command and it will be decoded and written to the corresponding command register.

Reset is of the same function as Power ON Reset (POR). Once RES receives a negative reset pulse of about 1us, all internal circuitry will be back to its initial status. Refer to Command Description section for more information.

### MPU Parallel 6800-series Interface

The parallel interface consists of 8 bi-directional data pins (D<sub>0</sub>-D<sub>7</sub>), R/W(WR), D/C, E(RD), CS1 and CS2. R/W(WR) input High indicates a read operation from the Graphic Display Data RAM (GDDDRAM) or the status register. R/W(WR) input Low indicates a write operation to Display Data RAM or Internal Command Registers depending on the status of D/C input. The E(RD) input serves as data latch signal (clock) when high provided that CS1 and CS2 are low and high respectively. Refer to Figure 1 of parallel timing characteristics for Parallel Interface Timing Diagram of 6800-series microprocessors.

In order to match the operating frequency of display RAM with that of the microprocessor, some pipeline processing is internally performed which requires the insertion of a dummy read before the first actual display data read. This is shown in Figure 4 below.

### MPU Parallel 8080-series interface

The parallel interface consists of 8 bi-directional data pins (D<sub>0</sub>-D<sub>7</sub>), E(RD), R/W(WR), D/C, CS1 and CS2. E(RD) input serves as data read latch signal (clock) when low provided that CS1 and CS2 are low and high respectively. Whether it is display data or status register read is controlled by D/C. R/W(WR) input serves as data write latch signal(clock) when high provided that CS1 and CS2 are low and high respectively. Whether it is display data or command register write is controlled by D/C. Refer to Figure 2 of parallel timing characteristics for Parallel Interface Timing Diagram of 8080-series microprocessor.

Similar to 6800-series interface, a dummy read is also required before the first actual display data read.

### MPU Serial interface

The serial interface consists of serial clock SCK, serial data SDA, D/C, CS1 and CS2. SDA is shifted into a 8-bit shift register on every rising edge of SCL in the order of D<sub>7</sub>, D<sub>6</sub>,... D<sub>0</sub>. D/C is sampled on every eighth clock and the data byte in the shift register is written to the Display Data RAM or command register in the same clock.

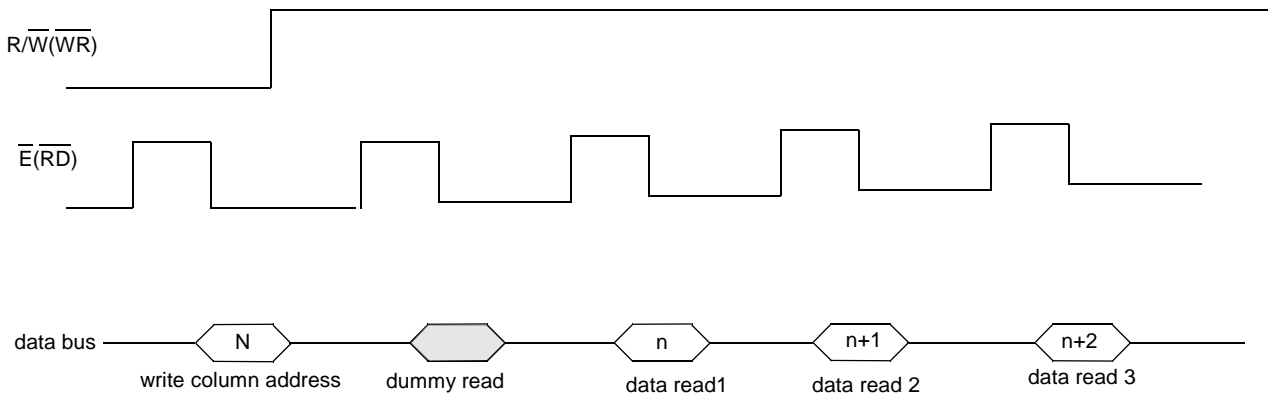

Figure 4: display data read with the insertion of dummy read

### Graphic Display Data RAM (GDDDRAM)

The GDDDRAM is a bit mapped static RAM holding the bit pattern to be displayed. The size of the RAM is 132 x 65= 8580 bits. Figure 5 is a description of the GDDDRAM address map. For mechanical flexibility, re-mapping on both Segment and Common outputs are pro-

vided. For vertical scrolling of display, an internal register storing the display start line can be set to control the portion of the RAM data to be mapped to the display. Figure 5 shows the case in which the display start line register is set at 38H.

Note: The configuration in parentheses represent the non-remapping of Rows and Columns

**Figure 5. Graphic Display Data RAM (GDDRAM) Address Map (with display start line value 38H) For 132 X 54 Graphic Display Mode**

### Oscillator Circuit

This module is an On-Chip low power RC oscillator circuitry (Figure 6). The oscillator generates the clock for the DC-DC voltage converter. This clock is also used in the Display Timing Generator.

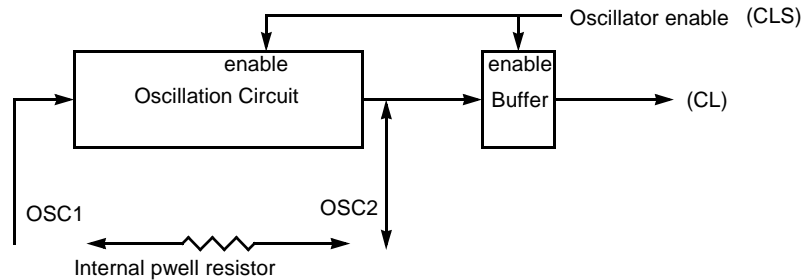

Figure 6. Oscillator Circuitry

### LCD Driving Voltage Generator and Regulator

This module generates the LCD voltage needed for display output. It takes a single supply input and generate necessary bias voltages. It consists of:

1. 2X, 3X and 4X DC-DC voltage converter  
Please refer to application notes.

2. Voltage Regulator (Voltages referenced to  $V_{DD}$ )

Feedback gain control for initial LCD voltage. External resistors are connected between  $V_{DD}$  and  $V_F$ , and between  $V_F$  and  $V_{L6}$ . These resistors are chosen to give the desired  $V_{L6}$  according to the following equation:

$$V_{L6} = (1 + R_2/R_1)V_{ref}$$

where  $V_{ref}$  is the internally generated reference voltage with a known  $R_1$  and  $R_2$ , and  $V_{ref}$  can be calculated by a measured  $V_{L6}$ .  $R_1$  and  $R_2$  are the resistance values of the resistors between  $V_{DD}$  and  $V_F$ , and  $V_F$  and  $V_{L6}$ , respectively.

3. Smart Bias Divider

Divide the regulator output to give the LCD driving voltages ( $V_{L2} - V_{L5}$ ). This is a low power consumption circuit which saves most of the display current.

4. Contrast Control (Voltages referenced to  $V_{DD}$ )

Software control of 64 voltage levels of LCD voltage.

5. Bias Ratio Selection circuitry

Software control of 1/6 and 1/8 bias ratio to match the characteristic of LCD panel. In addition, 1/4, 1/5, 1/7 and 1/9 bias ratios are software selectable for any mux application.

6. Self adjust temperature compensation circuitry

Provide 8 different compensation grade selections to satisfy the various liquid crystal temperature grades. The grading can be selected by software control. Defaulted temperature coefficient (TC) value is  $-0.05\%/^{\circ}\text{C}$ .

### 187 Bit Latch

A register carries the display signal information. In 132 X 55 display mode. Data will be fed to the HV-buffer Cell and level-shifted to the required level.

### Level Selector

Level Selector is a control of the display synchronization. Display voltage can be separated into two sets and used with different cycles. Synchronization is important since it selects the required LCD voltage level to the HV Buffer Cell, which in turn outputs the COM or SEG LCD waveform.

### HV Buffer Cell (Level Shifter)

HV Buffer Cell works as a level shifter which translates the low voltage output signal to the required driving voltage. The output is shifted out with an internal FRM clock which comes from the Display Timing Generator. The voltage levels are given by the level selector which is synchronized with the internal M signal.

### Reset Circuit

When  $\overline{\text{RES}}$  input is low, the chip is initialized with the following status:

1. Display is OFF
2. 132x48 [Not included ICONS line] Display Mode
3. Normal segment and display data column address mapping (SEG0 mapped to address 00H)
4. Read-modify-write mode is OFF
5. Power control register is set at 000B.
6. Shift register data clear in serial interface
7. Bias ratio is set at 1/8
8. Static indicator is OFF
9. Display start line is set at display RAM address 0
10. Column address counter is set at 0
11. Page address is set at 0
12. Normal scan direction of the COM outputs
13. Internal Regulator Resistor Ratio at 4
14. Contrast control register is set at 20H
15. Test mode is OFF
16. Temperature Coefficient is set to PTC0

### LCD Panel Driving Waveform

The following is an example of how the Common and Segment drivers may be connected to a LCD panel. The waveforms shown in Figure 7a and 7b illustrate the desired multiplex scheme.

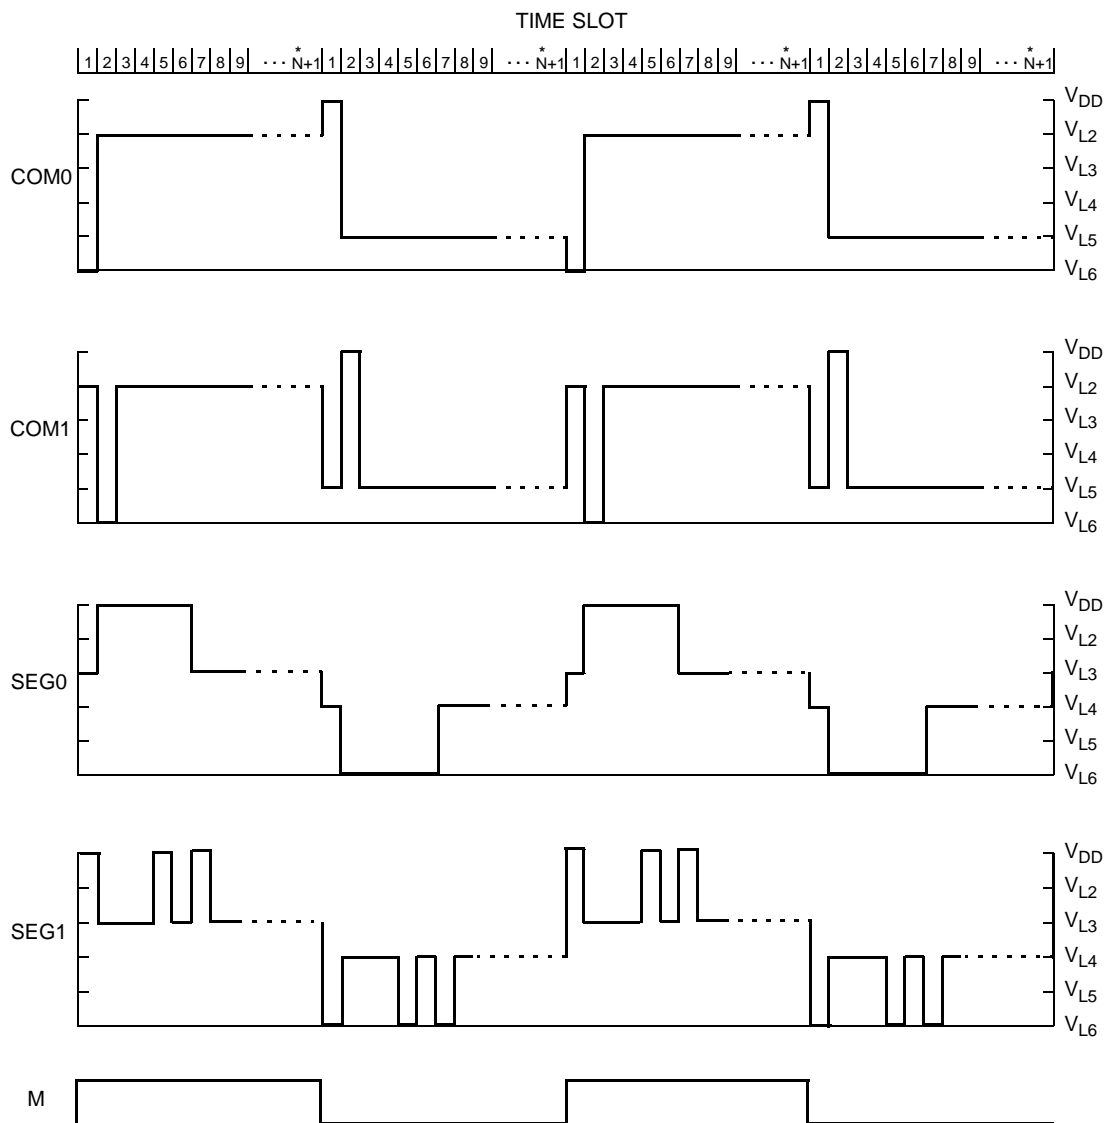

Figure 7a. LCD Display Example “0”

\* Note : N is the number of multiplex ratio not included Icon, N is equal to 54 on POR.

Figure 7b. LCD Driving Signal from SSD1812

## Command Description

### Set Display On/Off

This command alternatively turns the display on and off. When display off is issued with entire display on, power save mode will be entered. See “Set Power Save Mode” for details.

### Set Display Start Line

This command is to set **Display Start Line** register to determine starting address of display RAM to be displayed by selecting a value from 0 to 63. With value equals to 0, D0 of Page 0 is mapped to COM0. With value equals to 1, D1 of Page0 is mapped to COM0. The display start line values of 0 to 63 are assigned to Page 0 to 7.

### Set Page Address

This command positions the page address to 0 to 8 possible positions in GDDRAM. Refer to figure 5.

### Set Higher Column Address

This command specifies the higher nibble of the 8-bit column address of the display data RAM. The column address will be incremented by each data access after it is pre-set by the MCU.

### Set Lower Column Address

This command specifies the lower nibble of the 8-bit column address of the display data RAM. The column address will be incremented by each data access after it is pre-set by the MCU.

### Set Segment Re-map

This commands changes the mapping between the display data column address and segment driver. It allows flexibility in layout during LCD module assembly. Refer to figure 5.

### Set Normal/Reverse Display

This command sets the display to be either normal/reverse. In normal display, a RAM data of 1 indicates an “ON” pixel while in reverse display, a RAM data of 0 indicates an “ON” pixel. In icon mode, the icon line is not reversed by this command.

### Set Entire Display On/Off

This command forces the entire display, including the icon row, to be “ON” regardless of the contents of the display data RAM. This command has priority over normal/reverse display. This command will be used with “Set Display Display ON/OFF” command to form a compound command for entering power save mode. See “Set Power Save Mode”.

### Set LCD Bias

This command selects a suitable bias ratio (1/6 or 1/8) required for driving the particular LCD panel in use. The POR default for SSD1812 is set to 1/8 bias. For setting 1/4, 1/5, 1/7 and 1/9 bias, an extended compound command should be used.

### Set Read-Modify-Write Mode

This command puts the chip in read-modify-write mode in which:

1. the column address is saved before entering the mode
2. the column address is incremented by display data write but not by display data read

### Set End of Read-Modify-Write Mode

This command relieves the chip from read-modify-write mode. The column address that is saved before entering read-modify-write mode will be restored.

## Software Reset

This command causes some of the internal status of the chip to be initialized:

1. Display is OFF
3. Normal segment and display data column address mapping (SEG0 mapped to address 00H)
4. Read-modify-write mode is OFF
5. Power control register is set at 0
6. Bias ratio is set at 1/8
7. Static indicator is OFF
8. Display start line is set at display RAM address 0
9. Column address counter is set at 0
10. Page address is set at 0
11. Normal scan direction of the COM outputs
12. Internal Regulator Resistor Ratio at 4
13. Contrast control register is set at 20H
14. Test mode is OFF

## Set COM Output Scan Direction

This command sets the scan direction of the COM output allowing layout flexibility in LCD module assembly.

## Set Power Control Register

This command turns on/off the various power circuits associated with the chip.

## Set Internal Regulator Resistors Ratio

This command is to enable any one of the eight internal resistor sets for different regulator gain when using internal regulator resistor network (IRS pin pulled high). The relationship between the VL6 and the 64 levels of contrast step is TBD.

## Set Contrast Control Register

This commands adjusts the contrast of the LCD panel by changing V<sub>L6</sub> of the LCD drive voltage provided by the On-Chip power circuits. V<sub>L6</sub> is set with 64 steps (6-bit) contrast control register. It is a compound commands:

### Set Indicator On/Off

This command turns on and off the static drive indicators. It also controls whether standby mode or sleep mode will be entered after the power save compound command. See "Set Power Save Mode".

When the "Set Indicator On" command is sent, the "Indicator Display Mode" must be followed in the next command. The "Set Indicator Off" command is a single byte command and no following command is required.

### Set Power Save Mode

To enter Standby or Sleep Mode, it should be done by using a compound command composed of "Set Display ON/OFF" and "Set Entire Display ON/OFF" commands. When "Set Entire Display ON" is issued during display is OFF, either Standby Mode or Sleep Mode will be entered.

The status of the Static Indicator will determine which power save mode is entered. If static indicator is off, the Sleep Mode will be entered:

1. Internal oscillator and LCD power supply circuits are stopped
2. Segment and Common drivers output  $V_{DD}$  level
3. The display data and operation mode before sleep are held
4. Internal display RAM can still be accessed

If the static indicator is on, the chip enters Standby Mode which is similar to sleep mode except:

1. the internal oscillator is on
2. the static drive system is on

Note also that if the software reset command is issued during Standby Mode, Sleep Mode will be entered. Both power save modes can be exited by the issue of a new software command or by pulling Low at hardware pin RES.

### NOP

No Operation Command

### Set Test Mode

This command force the driver chip into its test mode for internal testing of the chip. Under normal operation, user should NOT use this command.

### Status register Read

This command is issued by setting  $D/\bar{C}$  Low during a data read (refer to figure 1 and 2 parallel interface waveform). It allows the MCU to monitor the internal status of the chip. No status read is provided for serial mode.

### EXTENDED COMMANDS

These commands are used, in addition to basic commands, to trigger the enhanced features, on top of general ones, designed for the chip.

### Set Multiplex Ratio

This command switches default 54 multiplex mode to any multiplex mode from 1 to 54. The chip pads ROW0-ROW63 will be switched to corresponding COM signal output, see Table 1.

### Set RAM Page Blinking Freq.

This command sets the blinking frequency of blinking page(s) which is set using the "Set RAM Page Blinking" extended command.

### Set Bias Ratio

Except the 1/4 bias, all the available bias ratio (1/5, 1/6, 1/7, 1/8, 1/9) could be set using this command. When changing the display multiplex ratio, the bias ratio also need to be adjusted to make display contrast consistent.

### Set Temperature Coefficient (TC) Value

This command is to set 1 out of 8 different temperature coefficients in order to match various liquid crystal temperature grades.

### Set 1/4 Bias Ratio

This command sets the bias ratio directly to 1/4 bias. This ratio is especially for use in under 12mux display.

In order to restore to other bias ratio, this command must be executed, with LSB=0, before the "Set Multiplex ratio" or "Set LCD Bias" command is sent.

### Set Display Offset

This command should be sent ONLY when the multiplex ratio is set less than 54.

When the multiplex ratio less than 54 is set, the display will be mapped in the middle (y-direction) of the LCD, see Table 1. Use this command could move the display vertically within the 54 commons.

To make the Reduced-Mux Com 0 (Com 0 after reducing the multiplex ratio) towards the Row 0 direction for L lines, the 6-bit data in second command should be given by L.

To move in the other direction by L lines, the 6-bit data should be given by 64-L.

Please note that the display is confined within the un-reduced 54 mux. That is maximum value of L is given by the half of 54 minus the reduced-multiplex ratio. For an odd display mux after reduction, moving away from Row 0 direction will has 1 more step.

### Set Smart Icon Mode

This command is used to enter/leave the Smart Icon Mode.

In Smart Icon Mode, Entire display will be turned off except the Icon row.

### Set RAM Page Blinking

This command enable the whole page to blink in the frequency set by "Set RAM Page Blinking Freq." command.

Setting either bit(s) in the data given in the second command will force corresponding page to blink. LSB of the data points to Page 0 and so on to MSB for Page 7.

## COMMAND TABLE

Bit Pattern	Write Command (D/C=0, R/W(WR)=0, $\overline{E}$ (RD)=1)	Comment
1010111X <sub>0</sub>	Set Display On/Off	X <sub>0</sub> =0: turns off LCD panel (POR) X <sub>0</sub> =1: turns on LCD panel
01X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>	Set Display Start Line	Set display RAM display start line register from 0-63 using X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> . Display start line register is reset to 000000 during POR.
1011X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>	Set Page Address	Set GDDRAM Page Address (0-8) using X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>
0001X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>	Set Higher Column Address	Set the higher nibble of the column address register using X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> as data bits. The initial display line register is reset to 0000 during POR.
0000X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>	Set Lower Column Address	Set the lower nibble of the column address register using X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> as data bits. The initial display line register is reset to 0000 during POR.
1010000X <sub>0</sub>	Set Segment Re-map	X <sub>0</sub> =0: column address 00H is mapped to SEG0 (POR) X <sub>0</sub> =1: column address 83H is mapped to SEG0 Refer to Fig. 5 for details.
1010011X <sub>0</sub>	Set Normal/Reverse Display	X <sub>0</sub> =0: normal display (POR) X <sub>0</sub> =1: reverse display
1010010X <sub>0</sub>	Set Entire Display On/Off	X <sub>0</sub> =0: normal display (POR) X <sub>0</sub> =1: entire display on
1010001X <sub>0</sub>	Set LCD Bias	X <sub>0</sub> =0: 1/8 bias (POR) X <sub>0</sub> =1: 1/6 bias For setting bias ratio to 1/4, 1/5, 1/7 or 1/9, see Extended Command Table.
11100000	Set Read-Modify-Write Mode	Read-modify-write mode will be entered in which the column address will not be incremented during display data read
11101110	Set End of Read-Modify-Write Mode	Exit Read-modify-write mode. Column address before entering the mode will be restored
11100010	Software Reset	Initialize the internal status
1100X <sub>3</sub> ***	Set COM Output Scan Direction	X <sub>3</sub> =0: normal mode (POR) X <sub>3</sub> =1: remapped mode. COM0 to COM[N-1] becomes COM[N-1] to COM0 in Multiplex ratio is equal to N. See Fig.5 as an example for N equal to 54.
00101X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>	Set Power Control Register	X <sub>0</sub> =0: turns off the output op-amp buffer (POR) X <sub>0</sub> =1: turns on the output op-amp buffer X <sub>1</sub> =0: turns off the internal regulator (POR) X <sub>1</sub> =1: turns on the internal regulator X <sub>2</sub> =0: turns off the internal voltage booster (POR) X <sub>2</sub> =1: turns on the internal voltage booster
00100X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>	Set Internal Regulator Resistor Ratio	Internal regulator gain increases as X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> increased from 000b to 111b. X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 100b (POR)
10000001 ** X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>	Set Contrast Control Register	Set Contrast level from 64 contrast steps. Contrast increases as X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> is increased. X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 100000b (POR)
1010110X <sub>0</sub>  ***** X <sub>1</sub> X <sub>0</sub>	Set Indicator On/Off  Indicator Display Mode, This second byte command is required ONLY when "Set Indicator On" command is sent.	X <sub>0</sub> = 0: indicator off (POR, no need of second command byte) X <sub>0</sub> = 1: indicator on (second command byte required)  X <sub>1</sub> X <sub>0</sub> = 00: indicator off X <sub>1</sub> X <sub>0</sub> = 01: indicator on and blinking at ~1 second interval X <sub>1</sub> X <sub>0</sub> = 10: indicator on and blinking at ~1/2 second interval X <sub>1</sub> X <sub>0</sub> = 11: indicator on constantly
*****	Set Power Save Mode	Standby or sleep mode will be entered with compound commands
11100011	NOP	Command for No Operation
1111****	Set Test Mode	Reserved for IC testing. Do NOT use.
11110000	Test Mode Reset	Reserved for IC testing. Do NOT use.

Bit Pattern	Read Command ( $\overline{D/C}=0$ , $R/\overline{W(WR)}=1$ , $\overline{E(RD)}=0$ )	Comment
D <sub>7</sub> D <sub>6</sub> D <sub>5</sub> D <sub>4</sub> D <sub>3</sub> D <sub>2</sub> D <sub>1</sub> D <sub>0</sub> (Data Read Back from the driver)	Status Register Read	D <sub>7</sub> =0: indicates an internal operation is completed. D <sub>7</sub> =1: indicates an internal operation is in progress. D <sub>6</sub> =0: indicates normal segment mapping with column address D <sub>6</sub> =1: indicates reverse segment mapping with column address D <sub>5</sub> =0: indicates the display is ON D <sub>5</sub> =1: indicates the display is OFF D <sub>4</sub> =0: initialization is not in progress D <sub>4</sub> =1: initialization is in progress after RES or software reset D <sub>3</sub> D <sub>2</sub> D <sub>1</sub> D <sub>0</sub> = 1010, these 4-bit is fixed to 1010 which could be used to identify as Solomon Systech Device.

### Data Read / Write

To read data from the GDDRAM, input High to  $\overline{R/W(WR)}$  pin and  $\overline{D/C}$  pin for 6800-series parallel mode, Low to  $\overline{E(RD)}$  pin and High to  $\overline{D/C}$  pin for 8080-series parallel mode. No data read is provided for serial mode. In normal mode, GDDRAM column address pointer will be increased by one automatically after each data read. However, no automatic increase will be performed in read-modify-write mode. Also, a dummy read is required before the first data read. See Figure 4 in Functional Description.

To write data to the GDDRAM, input Low to  $\overline{R/W(WR)}$  pin and High to  $\overline{D/C}$  pin for 6800-series parallel mode. For serial interface, it will always be in write mode. GDDRAM column address pointer will be increased by one automatically after each data write.

### Address Increment Table (Automatic)

$\overline{D/C}$	$\overline{R/W(WR)}$	Comment	Address Increment	Remarks
0	0	Write Command	No	
0	1	Read Status	No	
1	0	Write Data	Yes	
1	1	Read Data	Yes	*1

Address Increment is done automatically after data read write. The column address pointer of GDDRAM<sup>\*2</sup> is affected.

Remarks: \*1. If read data is issued in read-modify-write mode, address increase is not applied.

\*2. Column Address will NOT wrap round when overflow.

### Commands Required for $\overline{R/W(WR)}$ Actions on RAM

$\overline{R/W(WR)}$ Actions on RAMs	Commands Required	
Read/Write Data from/to GDDRAM.	Set GDDRAM Page Address Set GDDRAM Column Address  Read/Write Data	(1011X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> )* (0001X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> )* (0000X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> ) (X <sub>7</sub> X <sub>6</sub> X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> )
Save/Restore GDDRAM Column Address.	Save GDDRAM Column Address by read-modify-write mode Restore GDDRAM Column Address by end of read-modify-write mode	(11100000) (11101110)

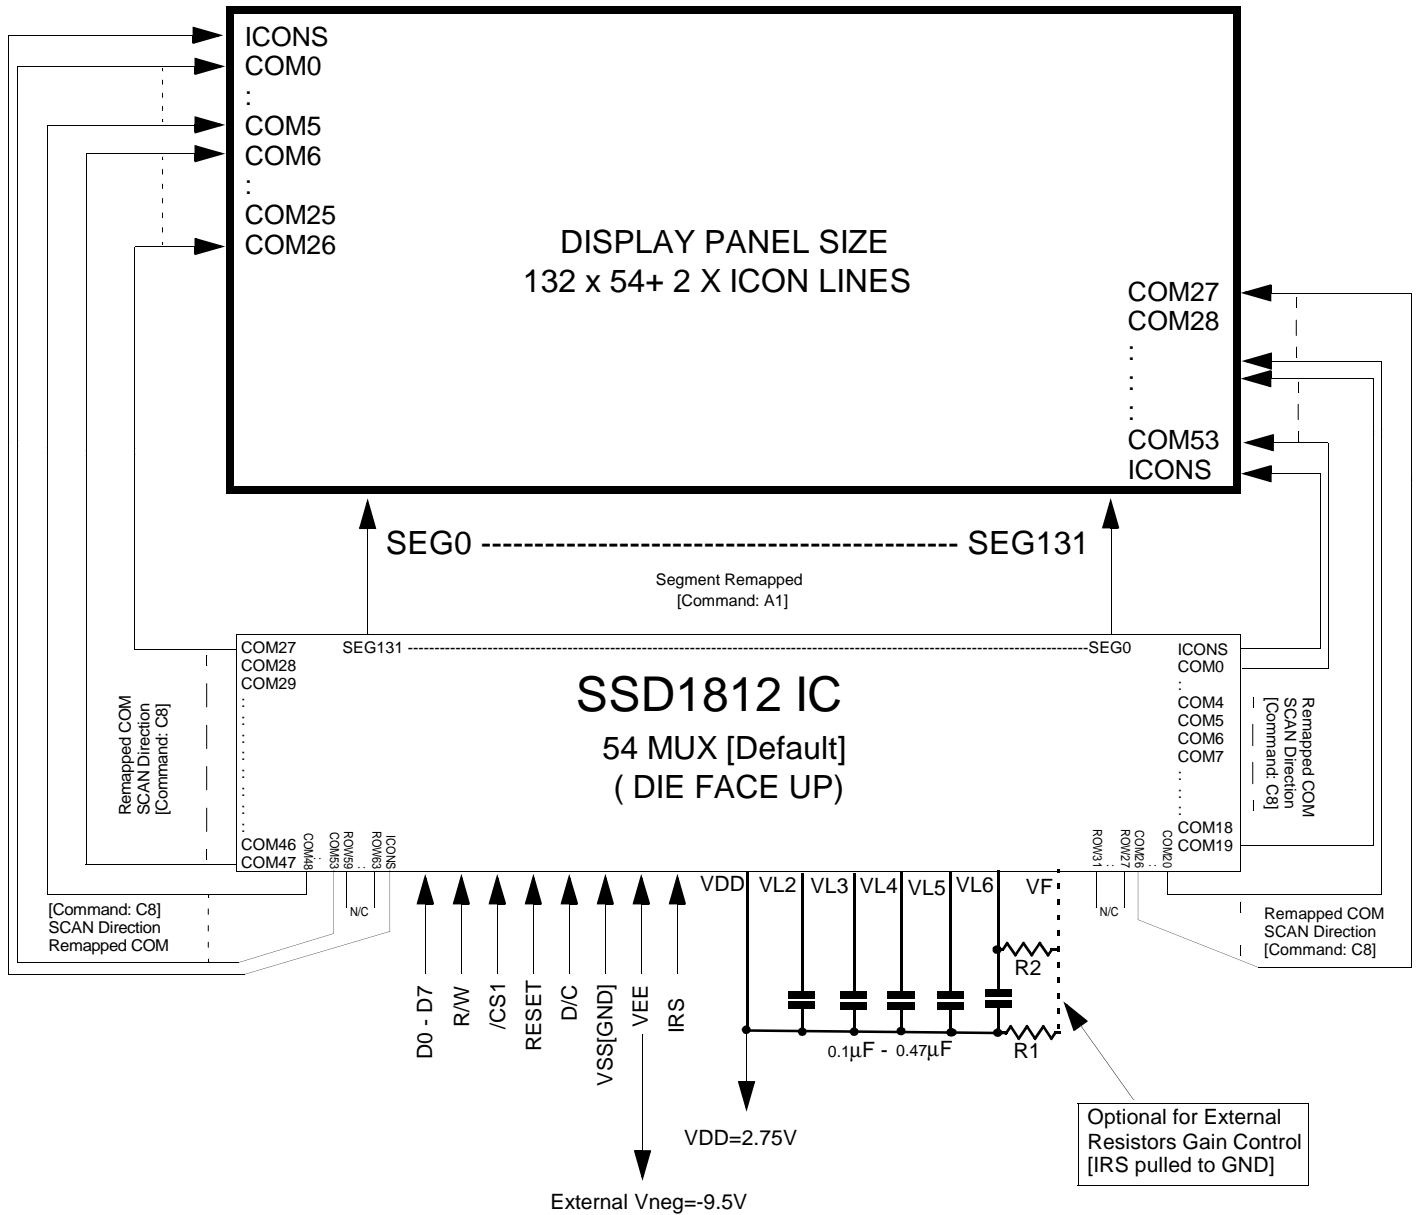

\* No need to resend the command again if it is set previously.

The read / write action to the Display Data RAM does not depend on the display mode. This means the user can change the RAM content whether the target RAM content is being displayed or not.

## EXTENDED COMMAND TABLE

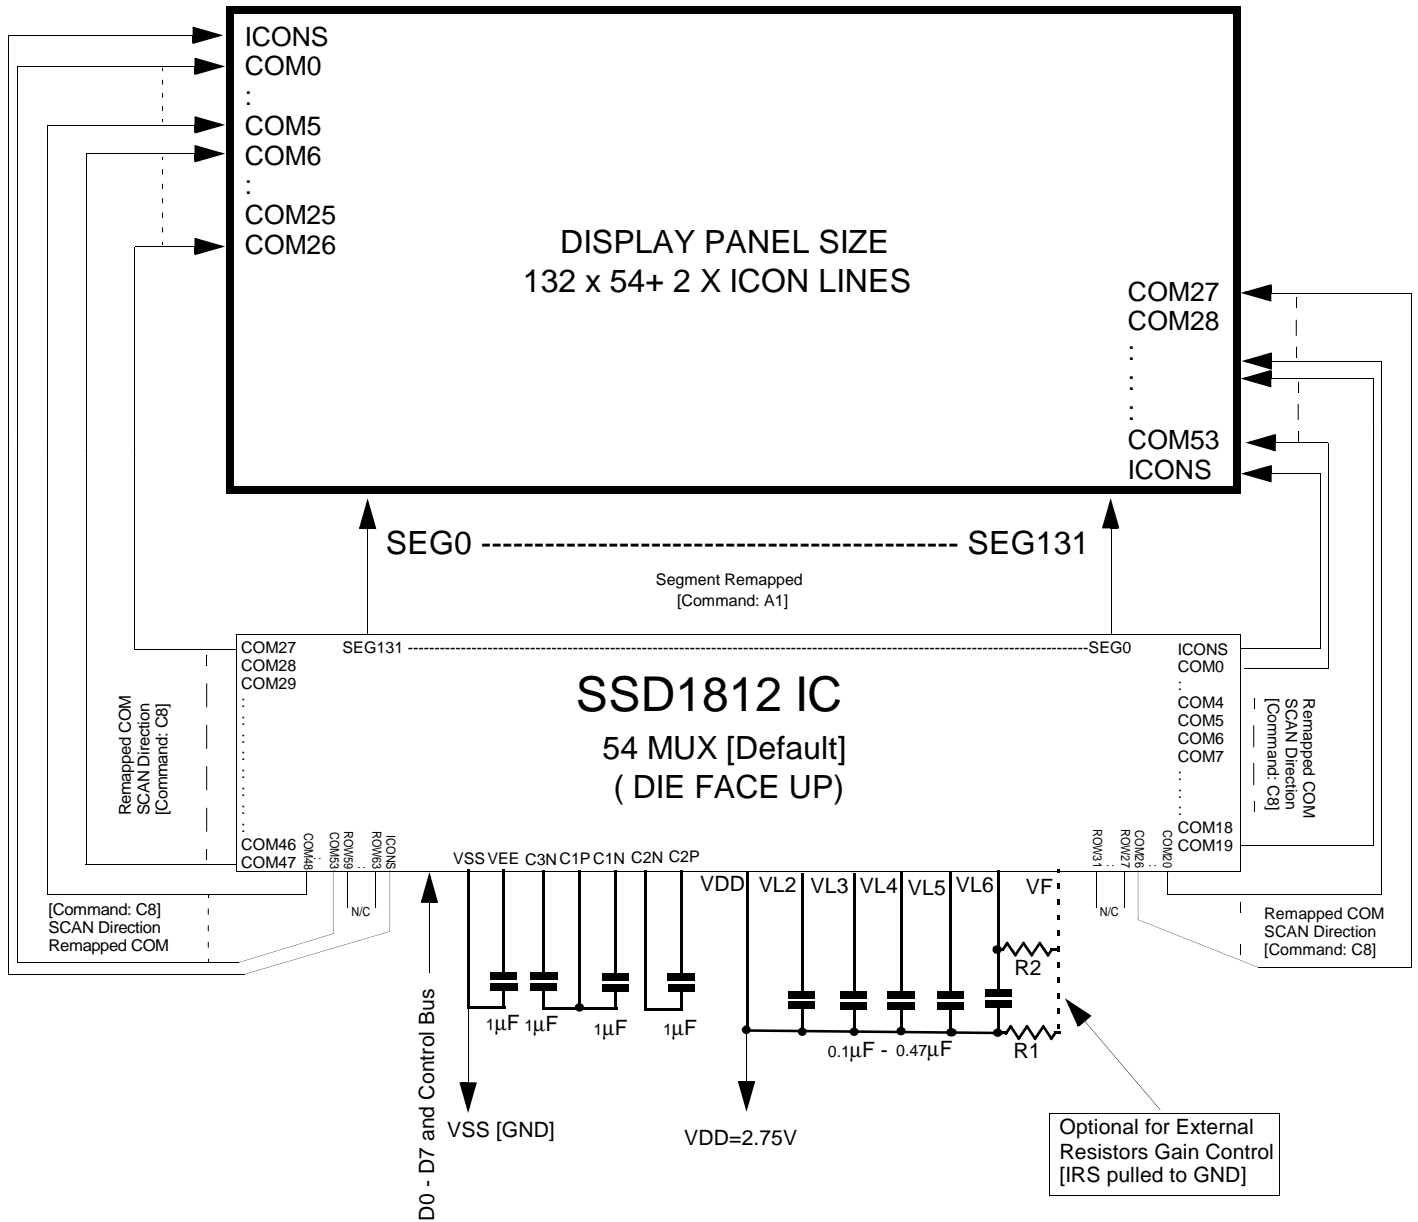

Bit Pattern	Command	Comment
10101000 X <sub>7</sub> X <sub>6</sub> X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>	X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> : Set Multiplex Ratio  X <sub>7</sub> X <sub>6</sub> : Set RAM Page Blinking Freq.	To select multiplex ratio N from 2 to 55 [Included Icon Line]. N = X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> + 2, eg. N = 110101b + 2 = 55 (POR)  X <sub>7</sub> X <sub>6</sub> = 00: 1.00sec (POR) X <sub>7</sub> X <sub>6</sub> = 01: 0.50sec X <sub>7</sub> X <sub>6</sub> = 10: 0.25sec X <sub>7</sub> X <sub>6</sub> = 11: always off
10101001 010X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>	X <sub>1</sub> X <sub>0</sub> : Set Bias Ratio  X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> : Set TC Value	X <sub>1</sub> X <sub>0</sub> = 00: 1/8, 1/6 (POR) X <sub>1</sub> X <sub>0</sub> = 01: 1/6, 1/5 X <sub>1</sub> X <sub>0</sub> = 10: 1/9, 1/7 X <sub>1</sub> X <sub>0</sub> = 11: Prohibited  X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> = 000: -0.01%/C (POR) X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> = 001: Reserved X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> = 010: -0.10%/C X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> = 011: Reserved X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> = 100: -0.18%/C X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> = 101: Reserved X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> = 110: Reserved X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> = 111: -0.25%/C
1010101X <sub>0</sub>	X <sub>0</sub> : Set 1/4 Bias Ratio	X <sub>0</sub> = 0: use original setting (POR) X <sub>0</sub> = 1: fixed 1/4 bias
11010010 X <sub>7</sub> X <sub>6</sub> X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>	Set Test Mode	Reserved for IC testing. Do NOT use.
11010011 00X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>	X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> : Set Display Offset (for mux ratio has been set less than 54 only)	After POR, X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 0 After setting mux ratio less than 54, data will be displayed at Center of matrix. See Table 1. To move display towards Row 0 by L, X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = L To move display away from Row 0 by L, X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 64-L Note: max. value of L = (54 - display mux)/2
1101000X <sub>0</sub>	X <sub>0</sub> : Set Smart Icon Mode	X <sub>0</sub> = 0: Normal display mode (POR) X <sub>0</sub> = 1: Smart Icon Mode
11010100 X <sub>7</sub> X <sub>6</sub> X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>	Set Test Mode	Reserved for IC testing. Do NOT use.
11010101 X <sub>7</sub> X <sub>6</sub> X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub>	Set RAM Page Blinking	After POR, X <sub>7</sub> X <sub>6</sub> X <sub>5</sub> X <sub>4</sub> X <sub>3</sub> X <sub>2</sub> X <sub>1</sub> X <sub>0</sub> = 00h Set either bit to "1" will set cooresponding page (0-7) to blink.

**Application Circuit: External VEE with internal regulator and divider mode [Command: 2B] in 54 Mux.**

Application Circuit: ALL internal power mode [Command: 2F] in 54 Mux [Default].

**PACKAGE DIMENSIONS**  
**SSD1812T**  
**TAB PACKAGE DIMENSION - 1**  
**(DO NOT SCALE THIS DRAWING)**

**NOTES FOR ALL PAGES**

1. DIMENSIONING AND TOLERANCING PER ANSI Y14.5M, 1982
2. IF NOT SPECIFIED, SIZE IN MILLIMETER
3. UNSPECIFIED DIMENSION TOLERANCE IS  $\pm 0.05$
4. BASE MATERIAL: 75 MICRON UPILEX-S
5. COPPER TYPE: 3/4 OZ COPPER (THICKNESS TYP. 25 MICROMETER, MIN 18 MICROMETER)
6. 4 SPROCKET HOLES DEVICE
7. OPTIONAL FEATURE FOR SSL INTERNAL USE ONLY WHICH MAY BE REPLACED BY  $\phi 2.0$  MM HOLE.

**PACKAGE DIMENSIONS**
