APPLICATIONS RECOMMENDATIONS

OPERATION LIMITS

The STM1645-30 power module should never be operated under any condition which exceeds the Absolute Maximum Ratings presented on this data sheet. Nor should the module be operated continuously at any of the specified maximum ratings. If the module is to be subjected to one or more of the maximum rating conditions, care must be taken to monitor other parameters which may be affected.

MODULE MOUNTING

To insure adequate thermal transfer from the module to the heatsink, it is recommended that a satisfactory thermal compound such as Dow Corning 340, Wakefield 120-2 or equivalent be applied between the module flange and the heatsink.

The heatsink mounting surface under the module should be flat to within ± 0.05 mm (± 0.002 Inch).

The module should be mounted to the heatsink using 3.5 mm (or 6-32) or equivalent screws torqued to 5-6 Kg-cm (4-6 in-lb).

The module leads should be attached to equipment PC board using 180°C solder applied to leads with a properly grounded soldering iron tip, not to exceed 195 °C, applied a minimum of 2 mm (0.080 inch) from the body of the module for a duration not to exceed 15 seconds per lead. It is imperative that no other portion of the module, other than the leads, be subjected to temperature in excess of 100 °C (maximum storage temperature), for any period of time, as the plastic moulded cover, internal components and sealing adhesives may be adversely affected by such conditions.

Due to the construction techniques and materials used within the module, reflow soldering of the flange heatsink or leads, is not recommended.
