

# STM705, STM706, STM707, STM708, STM813L

## 5V Supervisor

### FEATURES SUMMARY

- 5V OPERATING VOLTAGE
- PRECISION  $V_{CC}$  MONITOR
  - STM705/707/813L  
 $4.50V \leq V_{RST} \leq 4.75V$
  - STM706/708  
 $4.25 \leq V_{RST} \leq 4.50V$
- RST AND  $\overline{RST}$  OUTPUTS
- 200ms (TYP)  $t_{rec}$
- WATCHDOG TIMER - 1.6sec (TYP)
- MANUAL RESET INPUT ( $\overline{MR}$ )
- POWER-FAIL COMPARATOR (PFI/ $\overline{PFO}$ )
- LOW SUPPLY CURRENT - 40 $\mu$ A (TYP)
- GUARANTEED  $\overline{RST}$  (RST) ASSERTION DOWN TO  $V_{CC} = 1.0V$
- OPERATING TEMPERATURE:  
–40°C to 85°C (Industrial Grade)

### SUMMARY DESCRIPTION

The STM705/706/707/708/813L Supervisors are self-contained devices which provide microprocessor supervisory functions. A precision voltage reference and comparator monitors the  $V_{CC}$  input for an out-of-tolerance condition. When an invalid  $V_{CC}$  condition occurs, the reset output ( $\overline{RST}$ ) is forced low (or high in the case of  $RST$ ).

These devices also offer a watchdog timer (except for STM707/708) as well as a power-fail comparator to provide the system with an early warning of impending power failure.

These devices are available in a standard 8-pin SOIC package or a space-saving 8-pin TSSOP package.

**Pin Descriptions**

**MR.** A logic low on  $\overline{MR}$  asserts the reset output. Reset remains asserted as long as  $\overline{MR}$  is low and for  $t_{rec}$  after  $\overline{MR}$  returns high. This active-low input has an internal pull-up. It can be driven from a TTL or CMOS logic line, or shorted to ground with a switch. Leave open if unused.

**WDI.** If WDI remains high or low for 1.6sec, the internal watchdog timer runs out and reset (or  $\overline{WDO}$ ) is triggered. The internal watchdog timer clears while reset is asserted or when WDI sees a rising or falling edge.

The watchdog function can be disabled by allowing the WDI pin to float.

**WDO.** It goes low when a transition does not occur on WDI within 1.6sec, and remains low until a transition occurs on WDI (indicating the watchdog interrupt has been serviced).  $\overline{WDO}$  also goes low when  $V_{CC}$  falls below the reset threshold; however, unlike the reset output,  $\overline{WDO}$  goes high as soon as  $V_{CC}$  exceeds the reset threshold.

**Note:** For those devices with a  $\overline{WDO}$  output, a watchdog timeout will not trigger reset unless  $\overline{WDO}$  is connected to  $\overline{MR}$ .

**RST.** Pulses low when triggered, and stays low whenever  $V_{CC}$  is below the reset threshold or when  $\overline{MR}$  is a logic low. It remains low for  $t_{rec}$  after either  $V_{CC}$  rises above the reset threshold, or  $\overline{MR}$  goes from low to high.

**RST.** Goes high with triggered, and stays high whenever  $V_{CC}$  is above the reset threshold or when  $\overline{MR}$  is a logic high. It stays high for  $t_{rec}$  after either  $V_{CC}$  falls below the reset threshold, or  $\overline{MR}$  goes from high to low.

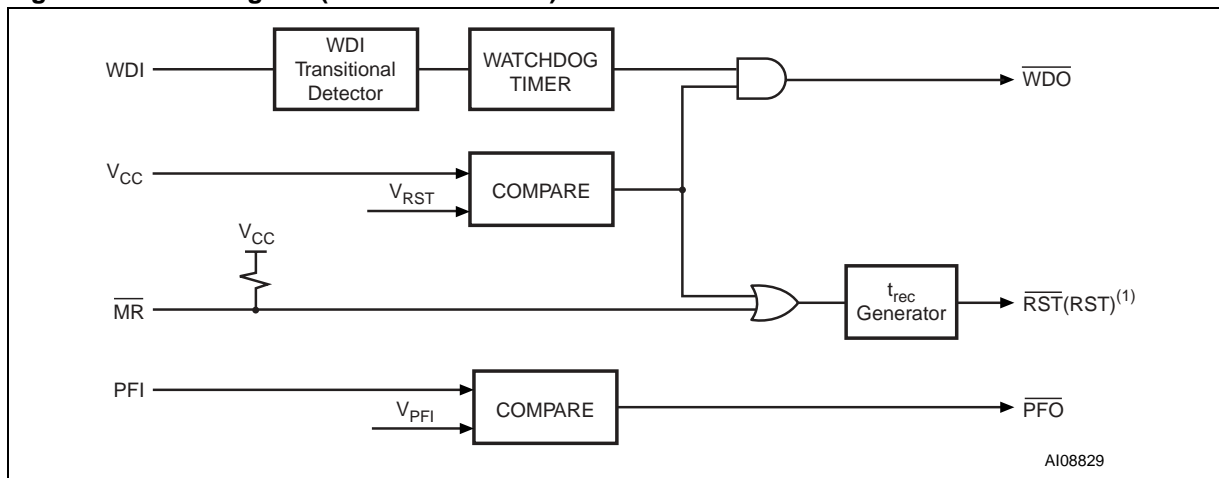

**PFI.** When  $PFI$  is less than  $V_{PFI}$ ,  $\overline{PFO}$  goes low; otherwise,  $\overline{PFO}$  remains high. Connect to ground if unused.

**PFO.** When  $PFI$  is less than  $V_{PFI}$ ,  $\overline{PFO}$  goes low; otherwise,  $\overline{PFO}$  remains high. Leave open if unused.

**Table 3. Pin Description**

Pin			Name	Function

## OPERATION

### Reset Output

The STM705/706/707/708/813L Supervisor asserts a reset signal to the MCU whenever  $V_{CC}$  goes below the reset threshold ( $V_{RST}$ ), a watchdog time-out occurs (if  $\overline{WDO}$  is tied to  $\overline{MR}$ ), or when the Push-button Reset Input ( $\overline{MR}$ ) is taken low.  $\overline{RST}$  is guaranteed to be a logic low (logic high for STM707/708/813L) for  $V_{CC} < V_{RST}$  down to  $V_{CC} = 1V$  for  $T_A = 0^{\circ}C$  to  $85^{\circ}C$ .

During power-up, once  $V_{CC}$  exceeds the reset threshold an internal timer keeps  $\overline{RST}$  low for the reset time-out period,  $t_{rec}$ . After this interval  $\overline{RST}$  returns high.

If  $V_{CC}$  drops below the reset threshold,  $\overline{RST}$  goes low. Each time  $\overline{RST}$  is asserted, it stays low for at least the reset time-out period ( $t_{rec}$ ). Any time  $V_{CC}$  goes below the reset threshold the internal timer clears. The reset timer starts when  $V_{CC}$  returns above the reset threshold.

### Push-button Reset Input

A logic low on  $\overline{MR}$  asserts reset. Reset remains asserted while  $\overline{MR}$  is low, and for  $t_{rec}$  (see [Figure 31., page 21](#)) after it returns high. The  $\overline{MR}$  input has an internal  $40k\Omega$  pull-up resistor, allowing it to be left open if not used. This input can be driven with TTL/CMOS-logic levels or with open-drain/collector outputs. Connect a normally open momentary switch from  $\overline{MR}$  to GND to create a manual reset function; external debounce circuitry is not required. If  $\overline{MR}$  is driven from long cables or the device is used in a noisy environment, connect a  $0.1\mu F$  capacitor from  $\overline{MR}$  to GND to provide additional noise immunity.  $\overline{MR}$  may float, or be tied to  $V_{CC}$  when not used.

### Watchdog Input (STM705/706/813L)

The watchdog timer can be used to detect an out-of-control MCU. If the MCU does not toggle the Watchdog Input (WDI) within  $t_{WD}$  (1.6sec), the reset is asserted. The internal 1.6sec timer is cleared by either:

1. a reset pulse, or
2. by toggling WDI (high-to-low or low-to-high), which can detect pulses as short as 50ns. If WDI is tied high or low, a reset pulse is triggered every 1.8sec ( $t_{WD} + t_{rec}$ ), if  $\overline{WDO}$  is connected to  $\overline{MR}$ .

See [Figure 32., page 21](#) for STM705/706/813L.

The timer remains cleared and does not count for as long as reset is asserted. As soon as reset is released, the timer starts counting.

**Note:** The watchdog function may be disabled by floating WDI or tri-stating the driver connected to WDI. When tri-stated or disconnected, the maximum allowable leakage current is 10uA and the maximum allowable load capacitance is 200pF.

### Watchdog Output (STM705/706/813L)

When  $V_{CC}$  drops below the reset threshold,  $\overline{WDO}$  will go low even if the watchdog timer has not yet timed out. However, unlike the reset output,  $\overline{WDO}$  goes high as soon as  $V_{CC}$  exceeds the reset threshold.  $\overline{WDO}$  may be used to generate a reset pulse by connecting it to the  $\overline{MR}$  input.

### Power-fail Input/Output

The Power-fail Input (PFI) is compared to an internal reference voltage (independent from the  $V_{RST}$  comparator). If PFI is less than the power-fail threshold ( $V_{PFI}$ ), the Power-Fail Output (PFO) will go low. This function is intended for use as an undervoltage detector to signal a failing power supply. Typically PFI is connected through an external voltage divider (see [Figure 10., page 8](#)) to either the unregulated DC input (if it is available) or the regulated output of the  $V_{CC}$  regulator. The voltage divider can be set up such that the voltage at PFI falls below  $V_{PFI}$  several milliseconds before the regulated  $V_{CC}$  input to the STM705/706/707/708/813L or the microprocessor drops below the minimum operating voltage.

If the comparator is unused, PFI should be connected to  $V_{SS}$  and  $\overline{PFO}$  left unconnected.  $\overline{PFO}$  may be connected to  $\overline{MR}$  on the STM703/704/818 so that a low voltage on PFI will generate a reset output.

**Ensuring a Valid Reset Output Down to  $V_{CC} = 0V$**

When  $V_{CC}$  falls below 1V, the state of the  $\overline{RST}$  output can no longer be guaranteed, and becomes essentially an open circuit. If a high value pull-down resistor is added to the  $\overline{RST}$  pin, the output will be held low during this condition. A resistor value of approximately 100k $\Omega$  will be large enough to not load the output under operating conditions, but still sufficient to pull  $\overline{RST}$  to ground during this low voltage condition (see Figure 11).

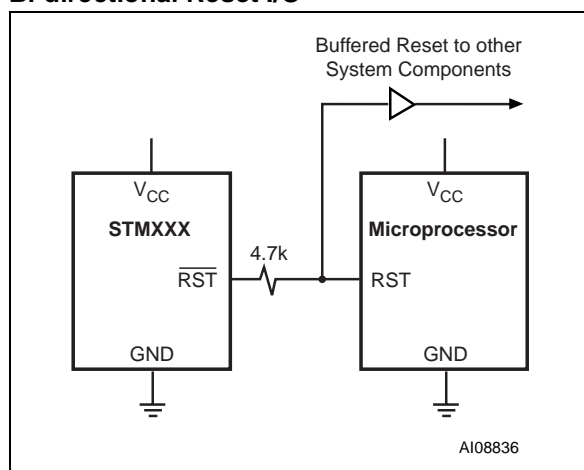

**Figure 11. Reset Output Valid to Ground Circuit**

**Interfacing to Microprocessors with Bi-directional Reset Pins**

Microprocessors with bi-directional reset pins can contend with the STM705-708 reset output. For example, if the reset output is driven high and the micro wants to pull it low, signal contention will result. To prevent this from occurring, connect a 4.7k $\Omega$  resistor between the reset output and the micro's reset I/O as in Figure 12.

**Figure 12. Interfacing to Microprocessors with Bi-directional Reset I/O**

## MAXIMUM RATING

Stressing the device above the rating listed in the Absolute Maximum Ratings table may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the Operating sections of this specification is not im-

plied. Exposure to Absolute Maximum Rating conditions for extended periods may affect device reliability. Refer also to the STMicroelectronics SURE Program and other relevant quality documents.

**Table 4. Absolute Maximum Ratings**

Symbol	Parameter	Value	Unit
T <sub>STG</sub>	Storage Temperature (V <sub>CC</sub> Off)	-55 to 150	°C
T <sub>SLD</sub> <sup>(1)</sup>	Lead Solder Temperature for 10 seconds	260	°C
V <sub>IO</sub>	Input or Output Voltage	-0.3 to V <sub>CC</sub> +0.3	V
V <sub>CC</sub>	Supply Voltage	-0.3 to 7.0	V
I <sub>O</sub>	Output Current	20	mA
P <sub>D</sub>	Power Dissipation	320	mW

Note: 1. Reflow at peak temperature of 255°C to 260°C for < 30 seconds (total thermal budget not to exceed 180°C for between 90 to 150 seconds).

### DC AND AC PARAMETERS

This section summarizes the operating measurement conditions, and the DC and AC characteristics of the device. The parameters in the DC and AC characteristics Tables that follow, are derived from tests performed under the Measurement

Conditions summarized in Table 5, Operating and AC Measurement Conditions. Designers should check that the operating conditions in their circuit match the operating conditions when relying on the quoted parameters.

**Table 5. Operating and AC Measurement Conditions**

Parameter	STM705/706/707/708; STM813L	Unit

**Table 9. Ordering Information Scheme**

Example:	STM705	M	6	E
<b>Device Type and Reset Threshold Voltage</b>				
STM705/707/813L = $V_{RST} = 4.50V$ to $4.75V$				
STM706/708 = $V_{RST} = 4.25V$ to $4.50V$				
<b>Package</b>				
M = SO8				
DS = TSSOP8				
<b>Temperature Range</b>				
6 = $-40$ to $85^{\circ}C$				
<b>Shipping Method</b>				
E = Tubes				
F = Tape & Reel				

For other options, or for more information on any aspect of this device, please contact the ST Sales Office nearest you.

**Table 10. Marking Description**

Part Number	Reset Threshold	Package	Topside Marking
STM705	4.63V	SO8	705
		TSSOP8	
STM706	4.38V	SO8	706
		TSSOP8	
STM707	4.63V	SO8	707
		TSSOP8	
STM708	4.38V	SO8	708
		TSSOP8	
STM813L	4.63V	SO8	813L
		TSSOP8	

## REVISION HISTORY

**Table 11. Document Revision History**

Date	Version	Revision Details
September 2003	1.0	First Issue
31-Oct-03	1.1	Update DC Characteristics (Table 6)
12-Dec-03	2.0	Reformatted; update characteristics (Figure 1, 2, 3, 4, 6, 8, 9, 10, 31, 32, 30; Table 6, 8, 10)
16-Jan-04	2.1	Add Typical Characteristics (Figure 13, 14, 15, 16, 17, 18, 19, 22, 23, 24, 25, 26, 27, 28)
09-Apr-04	3.0	Reformatted; update characteristics (Figure 15, 19, 22, 23, 24, 25, 28; Table 6)
25-May-04	4.0	Update characteristics (Table 3, 6)
02-Jul-04	5.0	Document promoted; corrected waveform (Figure 30)
21-Sep-04	6.0	Clarify root part numbers, pin descriptions (Figure 2, 3, 10; Table 5, 6, 9)
08-Mar-05	7.0	Update Typical Characteristics (Figure 13, 14, 15, 16, 17, 18, 19, 20, 21, 22, 23, 24, 25, 26, 27, 28)

Information furnished is believed to be accurate and reliable. However, STMicroelectronics assumes no responsibility for the consequences of use of such information nor for any infringement of patents or other rights of third parties which may result from its use. No license is granted by implication or otherwise under any patent or patent rights of STMicroelectronics. Specifications mentioned in this publication are subject to change without notice. This publication supersedes and replaces all information previously supplied. STMicroelectronics products are not authorized for use as critical components in life support devices or systems without express written approval of STMicroelectronics.
