

# QUINT LVPECL-TO-PECL OR PECL-TO-LVPECL TRANSLATOR

SY100E417

## FEATURES

- 3.3V and 5V power supplies required
- Also, supports LVPECL-to-PECL translation
- 500ps propagation delays
- Fully differential design
- Differential line receiver capability
- Available in 28-pin PLCC package

## BLOCK DIAGRAM

## DESCRIPTION

The SY100E417 is a quint LVPECL-to-PECL translator. It can also be used as a quint PECL-to-LVPECL translator. The device receives standard PECL signals and translates them to differential LVPECL output signals (or vice versa).

The SY100E417 can also be used as a differential line receiver for PECL-to-PECL or LVPECL-to-LVPECL signals. However, please note that for the latter we will need two different power supplies. Please refer to Function Table for more details.

A VBB output is provided for interfacing single ended input signals. If a single ended input is to be used, the VBB output should be connected to the  $\bar{D}_n$  input and the active signal will drive the  $D_n$  input. When used, the VBB should be bypassed to VCC via a 0.01 $\mu$ F capacitor. The VBB is designed to act as a switching reference for the SY100E417 under single ended input conditions. As a result, the pin can only source/sink 0.5mA of current.

To accomplish the PECL-to-LVPECL level translation, the SY100E417 requires three power rails. The VCC and VCC\_VBB supply is to be connected to the standard PECL supply, the 3.3V supply is to be connected to the VCCO supply, and GND is connected to the system ground plane. Both the VCC and VCCO should be bypassed to ground with a 0.01 $\mu$ F capacitor.

To accomplish the LVPECL-to-PECL level translation, the SY100E417 requires three power rails as well. The 5.0V supply is connected to the VCC and VCCO pins, 3.3V supply is connected to the VCC\_VBB pin and GND is connected to the system ground plane. VCC\_VBB is used to provide a proper VBB output level if a single ended input is used. VCC\_VBB = 3.3V is only required for single-ended LVPECL input. For differential LVPECL input, VCC\_VBB can be either 3.3V or 5.0V.

Under open input conditions, the  $\bar{D}_n$  input will be biased at a VCC/2 voltage level and the  $D_n$  input will be pulled to GND. This condition will force the "Qn" output low, ensuring stability.

## FUNCTION TABLE

Function	Vcc	Vcco	Vcc_VBB
PECL-to-LVPECL	5.0V	3.3V	5.0V
LVPECL-to-PECL	5.0V	5.0V	3.3V
PECL-to-PECL	5.0V	5.0V	5.0V
LVPECL-to-LVPECL	5.0V	3.3V	3.3V

**PIN CONFIGURATION**

**PIN NAMES**

Pin	Function
D <sub>n</sub>	PECL / LVPECL Inputs
Q <sub>n</sub>	PECL / LVPECL Outputs
V <sub>BB</sub>	Reference Voltage Output
V <sub>cco</sub>	Vcc for Outputs
V <sub>cc_VBB</sub>	Vcc for V <sub>BB</sub> Output
GND	Common Ground Rail
V <sub>cc</sub>	Vcc for Internal Circuitry

**PECL INPUT DC ELECTRICAL CHARACTERISTICS**

V<sub>cc\_VBB</sub> = V<sub>cc</sub> = +4.5V to +5.5V

Symbol	Parameter	T <sub>A</sub> = -40°C			T <sub>A</sub> = 0°C			T <sub>A</sub> = +25°C			T <sub>A</sub> = +85°C			Unit

**NOTES:**

- Power supply requirements applies as indicated in the DC electrical characteristics tables.
- Skew is measured between outputs under identical transitions.
- Duty cycle skew is the difference between a TPLH and TPHL propagation delay through a device Common Mode Range.
- Minimum input swing for which AC parameters are guaranteed. The device has a DC gain of ~40.
- The CMR range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between VPP min. and 1V.
