

3.3V 1:4 CLOCK DISTRIBUTION

ClockWorks™
SY100EL15L

FEATURES

- 3.3V power supply
- 50ps output-to-output skew
- Low power
- Synchronous enable/disable
- Multiplexed clock input
- 75KΩ internal input pull-down resistors
- ESD protection of 2000V
- Available in 16-pin SOIC package

DESCRIPTION

The SY100EL15L is a low skew 1:4 clock distribution IC designed explicitly for low skew clock distribution applications. The device can be driven by either a differential or single-ended ECL or, if positive power supplies are used, PECL input signal. If a single-ended input is to be used the VBB output should be connected to the CLK input and bypassed to ground via a 0.01μF capacitor. The VBB output is designed to act as the switching reference for the input of the EL15 under single-ended input conditions. As a result, this pin can only source/sink up to 0.5mA of current.

The EL15 features a multiplexed clock input to allow for the distribution of a lower speed scan or test clock along with the high speed system clock. When LOW (or left open and pulled LOW by the input pull-down resistor) the SEL pin will select the differential clock input.

The common enable (\bar{EN}) is synchronous so that the outputs will only be enabled/disabled when they are already in the LOW state. This avoids any chance of generating a runt clock pulse when the device is enabled/disabled as can happen with an asynchronous control. The internal flip flop is clocked on the falling edge of the input clock, therefore all associated specification limits are referenced to the negative edge of the clock input.

When both differential inputs are left open, CLK input will pull down to VEE and \bar{CLK} input will bias around $V_{CC}/2$.

NOTES:

1. This table replaces the three traditionally seen in ECL 100K data books. Outputs are terminated through a 50Ω resistor to -2.0V.
2. V_{IN} = V_{IH}(Max) or V_{IL}(Min).
3. V_{IN} = V_{IH}(Min) or V_{IL}(Max).
4. V_{IN} = V_{IL}(Max).

AC ELECTRICAL CHARACTERISTICSV_{EE} = 3.3V ±10%; V_{CC} = GND⁽¹⁾

t _H	Hold Time EN	400	—	400	—	400	—	—	400	—	ps
V _{PP}	Minimum Input Swing CLK	250	—	250	—	250	—	—	250	—	mV
V _{CMR}	Common Mode Range ⁽²⁾ V _{PP} < 500mV V _{PP} ≥ 500mV	-2.0 -1.8	-0.4 -0.4	-2.1 -1.9	-0.4 -0.4	-2.1 -1.9	—	-0.4 -0.4	-2.1 -1.9	-0.4 -0.4	mV
t _r t _f	Output Rise/Fall TimesQ (20% – 80%)	375	625	325	575	325	—	575	325	575	ps

NOTES:

1. Skews are specified for identical LOW-to-HIGH or HIGH-to-LOW transitions.
2. V_{CMR} is referenced to the most positive side of the differential input signal. Normal operation is obtained when the input signals are within the V_{CMR} range and the input swing is greater than V_{PP}(Min.) and <1V. The lower end of the V_{CMR} range varies 1:1 with V_{EE}. The numbers in the spec table assume a nominal V_{EE} = -3.3V. Note for PECL operation, the V_{CMR}(Min) will be fixed at 3.3V – |V_{CMR}(Min)|.
