APPLICATION NOTE

1. AM Low-Cut Circuit

- The AM Low-Cut action is carried out by the bypass of the high frequency component of the positive-feedback signal at the AF AMP stage. The external capacitor : C₃ by-passes this component.
- The cut-off frequency f_L is determined by the internal resistance 10kΩ (Typ.) and the external capacitor C₃ as following ;

$$f_L = \frac{1}{2 \times \pi \times 10 \times 10^3 \times C_3} \text{ (Hz)}$$

- In the case of the AM Low-Cut function is not needed, set up the value of C₃ over 1μF. In the condition of C₃ ≥ 1μF, the frequency characteristic has flat response at the low frequency.
- In FM mode, C₃ is a Capacitor for AFC Low-Pass filter circuit.

2. FM Detection Circuit

For the FM detection circuit, detection coil is able to use instead of ceramic discriminator. Recommended circuit and recommended coil are as follows. In this case, please take care that V_{in} (lim.) falls a little.
