1 FEATURES

- FM mixer for conversion of FM RF (64 to 108 MHz and US weather band) to IF of 10.7 MHz; the mixer provides inherent image rejection and can be switched from 'low' injection to 'high' injection Local Oscillator (LO) via the I²C-bus; two different mixer conversion gains can be selected via the I²C-bus
- AGC PIN diode drive circuit for FM RF AGC; AGC detection at FM mixer input; the AGC PIN diode drive can be activated via the I²C-bus as a local function for search tuning; AGC threshold is a programmable and keyed function switchable via the I²C-bus
- Digital alignment circuit for bus controlled matching of oscillator tuning voltage to FM antenna tank circuit tuning voltage
- Buffer output for weather band flag
- FM IF linear amplifier with high dynamic input range; amplifier gain can be switched to two different positions via the I²C-bus
- FM IF AGC with multiplexed inputs for FM and In-Band On-Channel Digital Audio Broadcast (IBOC DAB)
- Buffer amplifier for FM IBOC DAB IF bypassing second IF filter can be activated via I²C-bus
- AM mixer 1 for conversion of AM RF to AM IF1 10.7 MHz
- AM RF PIN diode drive circuit and RF JFET conductance control by AGC cascode drive circuit; AGC threshold detection at AM mixer 1 and IF2 AGC input; threshold is programmable via the I²C-bus
- AM noise blanker with blanking at AM IF2; AM noise blanker can be deactivated via the I²C-bus
- AM mixer 2 for conversion of AM IF1 to AM IF2 450 kHz
- AM IF2 AGC
- Multiplexer to output AM IF2 AGC and FM IF AGC to a car IF DSP IC (e.g. SAA7724H)
- AM/FM RF AGC monitor output
- Level detector for AM and FM with temperature compensated output voltage; starting point and slope of level output is programmable via the I²C-bus

- IF counter for AM IF2 and FM IF
- LC tuner oscillator providing mixer frequencies for FM mixer and AM mixer 1
- Crystal oscillator providing mixer frequencies for AM mixer 2 and reference for synthesizer PLL, IF count and timing for Radio Data System (RDS) update
- Fast synthesizer PLL tuning system with local control for inaudible RDS updating
- Timing function for RDS update algorithm and control signal output for a car IF DSP IC (e.g. SAA7724H)
- Three hardware programmable I²C-bus addresses; pin BUSENABLE; two software controlled flag outputs
- Several test modes for fast IC and system tests.

2 GENERAL DESCRIPTION

The TEF6700HL is a single chip car radio tuner for AM, FM standard, FM IBOC DAB and weather band providing gain controlled output of FM IF and AM IF2 for a car IF DSP IC (e.g. SAA7724H) including the following functions:

- AM double conversion tuner for LW/MW/SW (31 m, 41 m and 49 m bands) with IF1 = 10.7 MHz and IF2 = 450 kHz
- FM single conversion tuner to an IF frequency of 10.7 MHz with integrated image rejection for US FM, Europe FM, Japan FM, East Europe FM and weather band reception; all bands can be selected using high side or low side Local Oscillator (LO) injection
- Tuning system includes VCO, crystal oscillator and PLL synthesizer on one chip.

TEF6700HL

7 FUNCTIONAL DESCRIPTION

7.1 FM I/Q-mixer

The FM quadrature mixer converts FM RF (64 to 162.55 MHz) to an IF of 10.7 MHz. The FM mixer provides inherent image rejection and high RF sensitivity. The image rejection can be switched from 'low' injection Local Oscillator (LO) to 'high' injection LO via the I²C-bus. The mixer gain can be increased by 6 dB via the I²C-bus. In this case the threshold of the FM keyed AGC has to be lowered by 6 dB to prevent the mixer from being overloaded.

The mixer is capable of tuning the:

- US FM and US IBOC DAB from 87.9 to 107.9 MHz
- US weather FM from 162.4 to 162.55 MHz
- Europe FM from 87.5 to 108 MHz
- Japan FM from 76 to 91 MHz
- East Europe FM from 64 to 74 MHz.

7.2 Buffer output for weather band flag

The buffer output (pin WBFLAG) is HIGH for weather band mode.

7.3 VCO

The varactor tuned LC oscillator provides the local oscillator signal for both FM and AM mixer 1. It has a frequency range from 159.9 to 248.2 MHz.

7.4 Crystal oscillator

The crystal oscillator provides a 20.5 MHz signal that is used for:

- Reference frequency for frequency synthesizer PLL
- Local oscillator for AM mixer 2
- Reference frequency for the IF counter
- Timing signal for the RDS update algorithm.

7.5 PLL

The fast synthesizer PLL tuning system with local control is used for inaudible RDS updating.

7.6 DAA

To reduce the number of manual alignments in production the following I²C-bus controlled Digital Auto Alignment (DAA) functions are included:

- FM RF DAA
 - 7-bit DAA circuitry for the conversion of the VCO tuning voltage to a controlled alignment voltage for the FM antenna tank circuit
- FM and AM level DAA
 - Level DAA circuitry for alignment of slope (3-bit) and starting point (5-bit) of the level curve.

7.7 FM keyed AGC

The AGC threshold is programmable and the keyed AGC function is switchable via the I²C-bus. AGC detection occurs at the input of the FM mixer. If the keyed AGC function is activated, the AGC is keyed only by the narrow-band level. The AGC PIN diode drive can be activated via the I²C-bus as a local function for search tuning. The AGC sources a constant 10 mA current into the FM PIN diode in AM mode.

7.8 FM IF amplifier

The FM IF amplifier provides 10.5 or 14 dB gain, selectable via the I²C-bus with high linearity over a wide dynamic range. In IBOC DAB mode (activated via I²C-bus) FM IF is buffered and directly fed to FM IF AGC bypassing the second FM ceramic filter.

7.9 FM IF AGC

This is a linear FM IF AGC amplifier with multiplexed inputs for FM standard and FM IBOC DAB. The gain controlled FM IF is output by the multiplexed FM IF/AM IF2 buffer for a car IF DSP IC (e.g. SAA7724H).

Car radio tuner front-end for digital IF

TEF6700HL

7.10 AM tuner including mixer 1 and mixer 2

The AM tuner is realized in a double conversion technique and is capable of selecting LW, MW and SW bands.

AM mixer 1 converts AM RF to an IF1 of 10.7 MHz, while AM mixer 2 converts IF1 of 10.7 MHz to IF2 of 450 kHz:

- LW from 144 to 288 kHz
- MW from 522 to 1710 kHz (US AM band)
- SW from 5.73 to 9.99 MHz (including the 31 m, 41 m and 49 m bands).

7.11 AM RF AGC

The AM wideband AGC in front of the AM mixer 1 is realized first by a cascoded NPN transistor, which controls the transconductance of the RF amplifier JFET with 10 dB of AGC range. Second, an AM PIN diode stage with 30 dB of AGC range is available. The minimum JFET drain source voltage is controlled by a DC feedback loop (pin VAMCASFB) in order to limit the cascode AGC range to 10 dB. If the cascode AGC is not required, a simple RF AGC loop is possible by using only a PIN diode. In some conditions, noise behaviour will increase. In this case pins VAMCAS and VAMCASFB have to be left open-circuit. In FM mode, the cascode switches off the JFET bias current to reduce total power consumption. The PIN diode is biased by 1 mA in FM mode.

The AGC detection points for AM RF AGC are at the AM mixer 1 input (threshold programmable via the I²C-bus) and the IF2 AGC input (fixed threshold).

7.12 AM noise blanker

The detection point for the AM noise blanker is the output stage of AM mixer 1, while blanking is realized at the output of mixer 2.

7.13 AM IF2 AGC

This is a linear AM IF2 AGC amplifier. The gain controlled AM IF2 is output via the multiplexed FM IF/AM IF2 buffer to a car IF DSP IC (e.g. SAA7724H).

7.14 FM IF and AM IF2 buffer

This buffers and multiplexes AM IF2 and FM IF to pin IFOUT.

7.15 FM and AM level detector

The FM and AM level detectors provide the temperature compensated output voltage. The starting points and slopes of the level detector outputs are programmable via the I²C-bus.

7.16 FM/AM RF AGC buffer

The output (open-collector) sinks a current which in AM mode is proportional to the voltage at pin TRFAMAGC and in FM mode proportional to the RF level detector voltage (pin TFMAGC) inside the FM AGC.

V _{es}	electrostatic handling voltage	note 2	-200	+200	V
		note 3	-2000	+2000	V

Notes

- To avoid damages and wrong operation it is necessary to keep all 8.5 V supply voltages at a higher level than any 5 V supply voltage. This is also necessary during power-on and power-down sequences. Precautions have to be provided in such a way that interferences can not pull down the 8.5 V supply below the 5 V supply.
- Machine model (R = 0 Ω, C = 200 pF).
- Human body model (R = 1.5 kΩ, C = 100 pF).

TEF6700HL

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT
FM IF/AM IF2 buffer						
<i>Output: pin IFOUT</i>						
$Z_{L(min)}$	minimum load impedance for IF multiplexer/buffer		1	–	–	k Ω
$V_{o(max)(p)}$	maximum output voltage (peak value)		–	–	750	mV
RDS update						
<i>Output: pin AFHOLD; see Fig.6</i>						
$I_{sink(max)}$	maximum sink current	after first bus transmission with AF = 1; $V_o = 0.5$ V	1	1.2	1.4	mA

Notes

1. Measured between pins XTAL1 and XTAL2.
2. DAA conversion gain formula: $V_{DAAOUT} = \left[2 \times \left(0.75 \times \frac{n}{128} + 0.125 \right) \times (V_{DAAIN} + V_{DAATD}) \right] - V_{DAATD}$; where $n = 0$ to 127.
3. $V_{LSB} = V_{DAAOUT(n+1)} - V_{DAAOUT(n)}$
4. The AM AGC transconductance buffer delivers a sink current which is proportional to the voltage change at pin TRFAMAGC. $\Delta V_{TRFAMAGC} = V_{TRFAMAGC} - V_{TRFAMAGC}|_{(V_{AMMIX1IN} - V_{AMMIX1DEC}) < 10 \text{ mV}}$
5. Input parameters of AM IF2 measured between pins AMIF2IN and AMIF2DEC.
6. Image rejection ratio: $IRR = \frac{V_{(MIX1OUT1 - MIX1OUT2)wanted}}{V_{(MIX1OUT1 - MIX1OUT2)image}}$
7. Input parameters of FM IF amplifier measured between pins IFAMPIN and IFAMPDEC.
8. Input parameters of FM IF level detector measured between pins FMIFIN and FMIFDEC.

12 I²C-BUS PROTOCOL

12.1 I²C-bus specification

SDA and SCL HIGH and LOW levels are specified according to a 3.3 V I²C-bus. The bus pins tolerate also thresholds of a 5 V bus.

The standard I²C-bus specification is expanded by the following definitions.

IC addresses:

- 1st IC address C2H: 1100001 R/ \overline{W}
- 2nd IC address C0H: 1100000 R/ \overline{W}
- 3rd IC address C4H: 1100010 R/ \overline{W} .

Structure of the I²C-bus logic: slave transceiver with auto increment.

Subaddresses are not used.

The second I²C-bus address can be selected by connecting pin ADDRSEL via a 120 k Ω resistor to GND. The third I²C-bus address can be selected by connecting pin ADDRSEL via a 33 k Ω resistor to GND.

The maximum bit rate for this device is 100 kbits/s.

The I²C-bus interface is extended with an enable input (pin BUSENABLE). If pin BUSENABLE is HIGH the communication with the device is active; if pin BUSENABLE is LOW the signals on the I²C-bus are ignored so that higher bit rates (>100 kbits/s) can be used to communicate with other devices on the same I²C-bus. The enable signal must not change while bus communication takes place.

The data hold time $t_{HD;DAT}$ must be at least 1 μ s.

No default settings at power-on reset. I²C-bus transmission is required to program the IC.

12.1.1 DATA TRANSFER

Data sequence: address, byte 0, byte 1, byte 2, byte 3, byte 4, byte 5, and byte 6.

The data transfer has to be in this order. The LSB of the address being logic 0 indicates a write operation.

Bit 7 of each byte is considered the MSB and has to be transferred as the first bit of the byte.

The data becomes valid at the output of the internal latches with the acknowledge of each byte. A STOP condition after any byte can shorten transmission times.

When writing to the transceiver by using the STOP condition before completion of the whole transfer:

- The remaining bytes will contain the old information
- If the transfer of a byte is not completed, this byte is lost and the previous information is available.

12.1.2 FREQUENCY SETTING

For new frequency setting, in both AM and FM mode, the programmable divider is enabled by setting bit PRESET to logic 1. To select a frequency, two I²C-bus transmissions are necessary:

- First: bit PRESET = 1
- Second: bit PRESET = 0.

12.2 I²C-bus protocol

12.2.1 DATA TRANSFER MODE AND IC ADDRESS

Table 1 Write mode

S ⁽¹⁾	address (write)	A ⁽²⁾	data byte(s)	A ⁽²⁾	P ⁽³⁾
------------------	-----------------	------------------	--------------	------------------	------------------

Table 2 Read mode

S ⁽¹⁾	address (read)	A ⁽²⁾	data byte 0	NA ⁽⁴⁾	P ⁽³⁾
------------------	----------------	------------------	-------------	-------------------	------------------

Notes

1. S = START condition.
2. A = acknowledge.
3. P = STOP condition.
4. NA = no acknowledge.

Table 3 IC address byte

ADDRESS	IC ADDRESS ⁽¹⁾							MODE ⁽²⁾
1	1	1	0	0	0	0	1	R/ \overline{W}
2	1	1	0	0	0	0	0	R/ \overline{W}
3	1	1	0	0	0	1	0	R/ \overline{W}

Notes

1. Pin ADDRSEL left open-circuit activates 1st IC address; R_{ext} = 120 k Ω at pin ADDRSEL to ground activates 2nd IC address; R_{ext} = 33 k Ω at pin ADDRSEL to ground activates 3rd IC address.
2. Read or write bit:
0 = write operation to TEF6700HL
1 = read operation from TEF6700HL.

IFMT	FREF2	FREF1	FREF0	IFPR	BND1	BND0	AMFM

Table 11 Description of data byte 3 bits

BIT	SYMBOL	DESCRIPTION
7	IFMT	IF measuring time. If IFMT = 0, then IF measuring time is 20 ms. If IFMT = 1, then IF measuring time is 2 ms.
6 to 4	FREF[2:0]	Reference frequency for synthesizer. These 3 bits determine the reference frequency, see Table 12.
3	IFPR	IF counter prescaler ratio. If IFPR = 0, then IF prescaler ratio is 100. If IFPR = 1, then IF prescaler ratio is 10.
2 and 1	BND[1:0]	Band switch. These 2 bits select the frequency in AM and FM mode, see Tables 13 and 14.
0	AMFM	AM or FM switch. If AMFM = 0, then FM mode. If AMFM = 1, then AM mode.

Table 12 Reference frequency setting

FREF2	FREF1	FREF0	f_{ref} (kHz)
0	0	0	100
1	0	0	50
0	1	0	25

KAGC	AGC1	AGC0	LODX	FMINJ	IBOC	IFGAIN	MIXGAIN

Table 16 Description of data byte 4 bits

BIT	SYMBOL	DESCRIPTION
7	KAGC	Keyed FM AGC. If KAGC = 0, then keyed FM AGC is off. If KAGC = 1, then keyed FM AGC is on.
6 and 5	AGC[1:0]	Wideband AGC. These 2 bits set the start value of wideband AGC. For AM, see Table 17 and for FM, see Table 18.
4	LODX	Local or distance. If LODX = 0, then distance mode is on. If LODX = 1, then local mode is on.
3	FMINJ	FM mixer image rejection. If FMINJ = 0, then low injection. If FMINJ = 1, then high injection.
2	IBOC	FM IBOC mode. If IBOC = 0, then IBOC buffer amplifier is off. If IBOC = 1, then IBOC buffer amplifier is on.
1	IFGAIN	IF amplifier gain. If IFGAIN = 0, then $G_{IFAMP} = 10.5$ dB. If IFGAIN = 1, then $G_{IFAMP} = 14$ dB.
0	MIXGAIN	FM mixer gain. If MIXGAIN = 0, then the FM mixer gain is nominal. If MIXGAIN = 1, then the FM mixer gain is +6 dB.

16 SOLDERING

16.1 Introduction to soldering surface mount packages

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"Data Handbook IC26; Integrated Circuit Packages"* (document order number 9398 652 90011).

There is no soldering method that is ideal for all surface mount IC packages. Wave soldering can still be used for certain surface mount ICs, but it is not suitable for fine pitch SMDs. In these situations reflow soldering is recommended.

16.2 Reflow soldering

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement. Driven by legislation and environmental forces the worldwide use of lead-free solder pastes is increasing.

Several methods exist for reflowing; for example, convection or convection/infrared heating in a conveyor type oven. Throughput times (preheating, soldering and cooling) vary between 100 and 200 seconds depending on heating method.

Typical reflow peak temperatures range from 215 to 270 °C depending on solder paste material. The top-surface temperature of the packages should preferably be kept:

- below 220 °C (SnPb process) or below 245 °C (Pb-free process)
 - for all BGA and SSOP-T packages
 - for packages with a thickness ≥ 2.5 mm
 - for packages with a thickness < 2.5 mm and a volume ≥ 350 mm³ so called thick/large packages.
- below 235 °C (SnPb process) or below 260 °C (Pb-free process) for packages with a thickness < 2.5 mm and a volume < 350 mm³ so called small/thin packages.

Moisture sensitivity precautions, as indicated on packing, must be respected at all times.

16.3 Wave soldering

Conventional single wave soldering is not recommended for surface mount devices (SMDs) or printed-circuit boards with a high component density, as solder bridging and non-wetting can present major problems.

To overcome these problems the double-wave soldering method was specifically developed.

If wave soldering is used the following conditions must be observed for optimal results:

- Use a double-wave soldering method comprising a turbulent wave with high upward pressure followed by a smooth laminar wave.
- For packages with leads on two sides and a pitch (e):
 - larger than or equal to 1.27 mm, the footprint longitudinal axis is **preferred** to be parallel to the transport direction of the printed-circuit board;
 - smaller than 1.27 mm, the footprint longitudinal axis **must** be parallel to the transport direction of the printed-circuit board.

The footprint must incorporate solder thieves at the downstream end.

- For packages with leads on four sides, the footprint must be placed at a 45° angle to the transport direction of the printed-circuit board. The footprint must incorporate solder thieves downstream and at the side corners.

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Typical dwell time of the leads in the wave ranges from 3 to 4 seconds at 250 °C or 265 °C, depending on solder material applied, SnPb or Pb-free respectively.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

16.4 Manual soldering

Fix the component by first soldering two diagonally-opposite end leads. Use a low voltage (24 V or less) soldering iron applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C.

When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

TEF6700HL

16.5 Suitability of surface mount IC packages for wave and reflow soldering methods

PACKAGE ⁽¹⁾	SOLDERING METHOD	
	WAVE	REFLOW ⁽²⁾
BGA, LBGA, LFBGA, SQFP, SSOP-T ⁽³⁾ , TFBGA, VFBGA	not suitable	suitable
DHVQFN, HBCC, HBGA, HLQFP, HSQFP, HSOP, HTQFP, HTSSOP, HVQFN, HVSON, SMS	not suitable ⁽⁴⁾	suitable
PLCC ⁽⁵⁾ , SO, SOJ	suitable	suitable
LQFP, QFP, TQFP	not recommended ⁽⁵⁾⁽⁶⁾	suitable
SSOP, TSSOP, VSO, VSSOP	not recommended ⁽⁷⁾	suitable
PMFP ⁽⁸⁾	not suitable	not suitable

Notes

- For more detailed information on the BGA packages refer to the “(LF)BGA Application Note” (AN01026); order a copy from your Philips Semiconductors sales office.
- All surface mount (SMD) packages are moisture sensitive. Depending upon the moisture content, the maximum temperature (with respect to time) and body size of the package, there is a risk that internal or external package cracks may occur due to vaporization of the moisture in them (the so called popcorn effect). For details, refer to the Drypack information in the “Data Handbook IC26; Integrated Circuit Packages; Section: Packing Methods”.
- These transparent plastic packages are extremely sensitive to reflow soldering conditions and must on no account be processed through more than one soldering cycle or subjected to infrared reflow soldering with peak temperature exceeding $217\text{ °C} \pm 10\text{ °C}$ measured in the atmosphere of the reflow oven. The package body peak temperature must be kept as low as possible.
- These packages are not suitable for wave soldering. On versions with the heatsink on the bottom side, the solder cannot penetrate between the printed-circuit board and the heatsink. On versions with the heatsink on the top side, the solder might be deposited on the heatsink surface.
- If wave soldering is considered, then the package must be placed at a 45° angle to the solder wave direction. The package footprint must incorporate solder thieves downstream and at the side corners.
- Wave soldering is suitable for LQFP, TQFP and QFP packages with a pitch (e) larger than 0.8 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.65 mm.
- Wave soldering is suitable for SSOP, TSSOP, VSO and VSSOP packages with a pitch (e) equal to or larger than 0.65 mm; it is definitely not suitable for packages with a pitch (e) equal to or smaller than 0.5 mm.
- Hot bar or manual soldering is suitable for PMFP packages.

17 DATA SHEET STATUS

LEVEL	DATA SHEET STATUS ⁽¹⁾	PRODUCT STATUS ⁽²⁾⁽³⁾	DEFINITION
I	Objective data	Development	This data sheet contains data from the objective specification for product development. Philips Semiconductors reserves the right to change the specification in any manner without notice.
II	Preliminary data	Qualification	This data sheet contains data from the preliminary specification. Supplementary data will be published at a later date. Philips Semiconductors reserves the right to change the specification without notice, in order to improve the design and supply the best possible product.
III	Product data	Production	This data sheet contains data from the product specification. Philips Semiconductors reserves the right to make changes at any time in order to improve the design, manufacturing and supply. Relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN).

Notes

1. Please consult the most recently issued data sheet before initiating or completing a design.
2. The product status of the device(s) described in this data sheet may have changed since this data sheet was published. The latest information is available on the Internet at URL <http://www.semiconductors.philips.com>.
3. For data sheets describing multiple type numbers, the highest-level product status determines the data sheet status.

18 DEFINITIONS

Short-form specification — The data in a short-form specification is extracted from a full data sheet with the same type number and title. For detailed information see the relevant data sheet or data handbook.

Limiting values definition — Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 60134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.

Application information — Applications that are described herein for any of these products are for illustrative purposes only. Philips Semiconductors make no representation or warranty that such applications will be suitable for the specified use without further testing or modification.

19 DISCLAIMERS

Life support applications — These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips Semiconductors customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips Semiconductors for any damages resulting from such application.

Right to make changes — Philips Semiconductors reserves the right to make changes in the products - including circuits, standard cells, and/or software - described or contained herein in order to improve design and/or performance. When the product is in full production (status 'Production'), relevant changes will be communicated via a Customer Product/Process Change Notification (CPCN). Philips Semiconductors assumes no responsibility or liability for the use of any of these products, conveys no licence or title under any patent, copyright, or mask work right to these products, and makes no representations or warranties that these products are free from patent, copyright, or mask work right infringement, unless otherwise specified.

20 PURCHASE OF PHILIPS I²C COMPONENTS

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
