TPA6204A1

SLOS429 - MAY 2004

1.7-W MONO FULLY DIFFERENTIAL AUDIO POWER AMPLIFIER

FEATURES

- **Designed for Wireless or Cellular Handsets** and PDAs
- 1.7 W Into 8 Ω From a 5-V Supply at THD = 10% (Typ)
- Low Supply Current: 4 mA typ at 5 V
- Shutdown Current: 0.01 µA Typ
- **Fast Startup With Minimal Pop**
- **Only Three External Components**
 - Improved PSRR (–80 dB) and Wide Supply Voltage (2.5 V to 5.5 V) for Direct Battery Operation
 - Fully Differential Design Reduces RF Rectification
 - –63 dB CMRR Eliminates Two Input **Coupling Capacitors**
- Pin to Pin Compatible With TPA2005D1 and TPA6211A1 in QFN Package
- Available in 3 mm X 3 mm QFN Package (DRB)

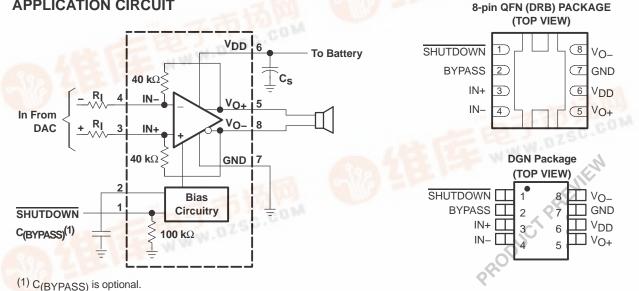

APPLICATIONS

- **Ideal for Wireless Handsets**
- **PDAs**
- **Notebook Computers**

DESCRIPTION

The TPA6204A1 is a 1.7-W mono fully-differential amplifier designed to drive a speaker with at least 8- Ω impedance while consuming only 20 mm² total printed-circuit board (PCB) area in most applications. The device operates from 2.5 V to 5.5 V, drawing only 4 mA of quiescent supply current. The TPA6204A1 is available in the space-saving 3 mm x 3 mm QFN (DRB) package.

The TPA6204A1 is ideal for PDA/smart phone applications due to features such as -80-dB supply voltage rejection from 20 Hz to 2 kHz, improved RF rectification immunity, small PCB area, and a fast startup with minimal pop.

DFlease be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

APPLICATION CIRCUIT

SLOS429 - MAY 2004

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

ORDERING INFORMATION

	PACKAGED DEVICE				
	QFN (DRB)	MSOP (DGN)			
Device	TPA6204A1DRB	TPA6204A1DGN			
Symbolization	AYJ	TBD			

(1) The DRB is only available taped and reeled. To order taped and reeled parts, add the suffix R to the part number (TPA6204A1DRBR).

TERMINAL FUNCTIONS

TERM	INAL	1/0	DESCRIPTION	
NAME	DRB	1/0	DESCRIPTION	
IN-	4	Ι	Negative differential input	
IN+	3	I	Positive differential input	
V _{DD}	6	I	Power supply	
V _{O+}	5	0	Positive BTL output	
GND	7	I	High-current ground	
V _O -	8	0	Negative BTL output	
SHUTDOWN	1	Ι	Shutdown terminal (active low logic)	
BYPASS	2		Mid-supply voltage, adding a bypass capacitor improves PSRR	
Thermal Pad	-	-	Connect to ground. Thermal pad must be soldered down in all applications to properly secure device on the PCB.	

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted⁽¹⁾

		UNIT
Supply voltage, V _{DD}		–0.3 V to 6 V
Input voltage, VI		–0.3 V to V _{DD} + 0.3 V
Continuous total power dissipation		See Dissipation Rating Table
Operating free-air temperature, T _A		-40°C to 85°C
Junction temperature, TJ		-40°C to 150°C
Storage temperature, T _{Stg}		–65°C to 85°C
Lead temperature 1,6 mm (1/16 Inch) from case for 10 seconds	DRB	260°C

(1) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

SLOS429 - MAY 2004

APPLICATION INFORMATION

FULLY DIFFERENTIAL AMPLIFIER

The TPA6204A1 is a fully differential amplifier with differential inputs and outputs. The fully differential amplifier consists of a differential amplifier and a common-mode amplifier. The differential amplifier ensures that the amplifier outputs a differential voltage that is equal to the differential input times the gain. The common-mode feedback ensures that the common-mode voltage at the output is biased around $V_{DD}/2$ regardless of the common-mode voltage at the input.

Advantages of Fully Differential Amplifiers

- Input coupling capacitors not required: A fully differential amplifier with good CMRR, like the TPA6204A1, allows the inputs to be biased at voltage other than mid-supply. For example, if a DAC has mid-supply lower than the mid-supply of the TPA6204A1, the common-mode feedback circuit adjusts for that, and the TPA6204A1 outputs are still biased at mid-supply of the TPA6204A1. The inputs of the TPA6204A1 can be biased from 0.5 V to V_{DD} 0.8 V. If the inputs are biased outside of that range, input coupling capacitors are required.
- Mid-supply bypass capacitor, C_(BYPASS), not required: The fully differential amplifier does not require a bypass capacitor. This is because any shift in the mid- supply affects both positive and negative

channels equally and cancels at the differential output. However, removing the bypass capacitor slightly worsens power supply rejection ratio (k_{SVR}), but a slight decrease of k_{SVR} may be acceptable when an additional component can be eliminated.

 Better RF-immunity: GSM handsets save power by turning on and shutting off the RF transmitter at a rate of 217 Hz. The transmitted signal is picked-up on input and output traces. The fully differential amplifier cancels the signal much better than the typical audio amplifier.

APPLICATION SCHEMATICS

Figure 15 through Figure 17 show application schematics for differential and single-ended inputs. Typical values are shown in Table 1.

Table 1. Typical Component Values

COMPONENT	VALUE

SLOS429 - MAY 2004

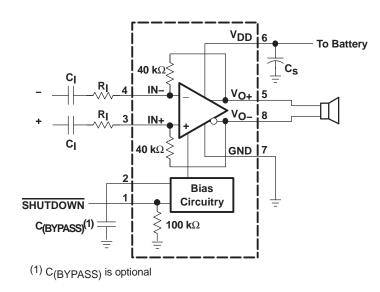

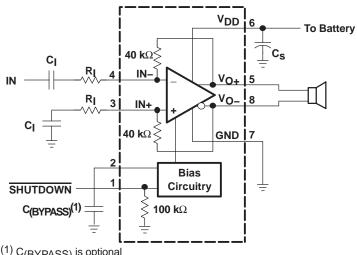

Figure 16. Differential Input Application Schematic Optimized With Input Capacitors

(1) C(BYPASS) is optional
(2) Due to the fully differential design of this amplifier, the performance is severly degraded if you connect the unused input to **BYPASS** when using single-ended inputs.

Figure 17. Single-Ended Input Application Schematic

SLOS429 - MAY 2004

SELECTING COMPONENTS

Resistors (R_I)

The input resistor (R_I) can be selected to set the gain of the amplifier according to equation 1.

Gain = R_F/R_I (1) The internal feedback resistors (R_F) are trimmed to 40 k Ω .

Resistor matching is very important in fully differential amplifiers. The balance of the output on the reference voltage depends on matched ratios of the resistors. CMRR, PSRR, and the cancellation of the second harmonic distortion diminishes if resistor mismatch occurs. Therefore, it is recommended to use 1% tolerance resistors or better to keep the performance optimized.

USING LOW-ESR CAPACITORS

Low-ESR capacitors are recommended throughout this applications section. A real (as opposed to ideal) capacitor can be modeled simply as a resistor in series with an ideal capacitor. The voltage drop across this resistor minimizes the beneficial effects of the capacitor in the circuit. The lower the equivalent value of this resistance the more the real capacitor behaves like an ideal capacitor.

Bypass Capacitor (CBYPASS) and Start-Up Time

The internal voltage divider at the BYPASS pin of this device sets a mid-supply voltage for internal references and sets the output common mode voltage to $V_{DD}/2$. Adding a capacitor to this pin filters any noise into this pin and increases k_{SVR} . $C_{(BYPASS)}$ also determines the rise time of V_{O+} and V_{O-} when the device is taken out of shutdown. The larger the capacitor, the slower the rise time. NO TAGNO TAGNO TAGNO TAGNO TAGNO TAG show the relationship of $C_{(BYPASS)}$ to start-up time.

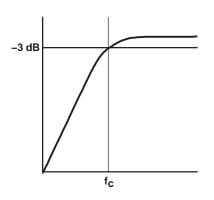

Input Capacitor (CI)

The TPA6204A1 does not require input coupling capacitors if using a differential input source that is biased from 0.5 V to V_{DD} – 0.8 V. Use 1% tolerance or better gain-setting resistors if not using input coupling capacitors.

In the single-ended input application an input capacitor, C_I , is required to allow the amplifier to bias the input signal to the proper dc level. In this case, C_I and R_I form a high-pass filter with the corner frequency determined in equation 2.

$$f_{C} = \frac{1}{2\pi R_{I}C_{I}}$$
(2)

TEXAS INSTRUMENTS www.ti.com

The value of C_I is important to consider as it directly affects the bass (low frequency) performance of the circuit. Consider the example where R_I is 10 k Ω and the specification calls for a flat bass response down to 100 Hz. Equation 2 is reconfigured as equation 3.

$$C_{|} = \frac{1}{2\pi R_{|}f_{c}}$$
(3)

In this example, C_I is 0.16 μ F, so one would likely choose a value in the range of 0.22 μ F to 0.47 μ F. Ceramic capacitors should be used when possible, as they are the best choice in preventing leakage current. When polarized capacitors are used, the positive side of the capacitor should face the amplifier input in most applications, as the dc level there is held at V_{DD}/2, which is likely higher than the source dc level. It is important to confirm the capacitor polarity in the application.

Decoupling Capacitor (C_S)

The TPA6204A1 is a high-performance CMOS audio amplifier that requires adequate power supply decoupling to ensure the output total harmonic distortion (THD) is as low as possible. Power supply decoupling also prevents oscillations for long lead lengths between the amplifier and the speaker. For higher frequency transients, spikes, or digital hash on the line, a good low equivalent-series-resistance (ESR) ceramic capacitor, typically 0.1 μ F to 1 μ F, placed as close as possible to the device V_{DD} lead works best. For filtering lower frequency noise signals, a 10- μ F or greater capacitor placed near the audio power amplifier also helps, but is not required in most applications because of the high PSRR of this device.

SLOS429 - MAY 2004

FULLY DIFFERENTIAL AMPLIFIER **EFFICIENCY AND THERMAL INFORMATION**

Class-AB amplifiers are inefficient. The primary cause of these inefficiencies is voltage drop across the output stage transistors. There are two components of the internal voltage drop. One is the headroom or dc voltage drop that varies inversely to output power. The second component is due to the sinewave nature of the output. The total voltage drop can be calculated by subtracting the RMS value of the output voltage from V_{DD}. The internal voltage drop multiplied by the average value of the supply current, IDD(avg), determines the internal power dissipation of the amplifier.

An easy-to-use equation to calculate efficiency starts out as being equal to the ratio of power from the power supply to the power delivered to the load. To accurately calculate the RMS and average values of power in the load and in the amplifier, the current and voltage waveform shapes must first be understood (see Figure 18).

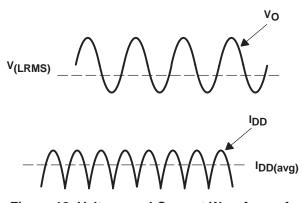

Figure 18. Voltage and Current Waveforms for **BTL Amplifiers**

Although the voltages and currents for SE and BTL are sinusoidal in the load, currents from the supply are different between SE and BTL configurations. In an SE application the current waveform is a half-wave rectified shape, whereas in BTL it is a full-wave rectified waveform. This means RMS conversion factors are different. Keep in mind that for most of the waveform both the push and pull transistors are not on at the same time, which supports the fact that each amplifier in the BTL device only draws current from the supply for half the waveform. The following equations are the basis for calculating amplifier efficiency.

Efficiency of a BTL amplifier =

Where:

$$P_L = \frac{V_L \text{rms}^2}{R_L}$$
, and $V_{LRMS} = \frac{V_P}{\sqrt{2}}$, therefore, $P_L = \frac{V_P^2}{2R_L}$

and
$$P_{SUP} = V_{DD} I_{DD} avg$$
 and $I_{DD} avg = \frac{1}{\pi} \int_0^{\pi} \frac{V_P}{R_L} \sin(t) dt = -\frac{1}{\pi} \times \frac{V_P}{R_L} [\cos(t)] \frac{\pi}{0} \frac{2V_P}{\pi R_L}$

 \sim

Therefore,

$$\mathsf{P}_{\mathsf{SUP}} = \frac{2\,\mathsf{V}_{\mathsf{DD}}\,\mathsf{V}_{\mathsf{P}}}{\pi\,\mathsf{R}_{\mathsf{L}}}$$

substituting P₁ and P_{SUP} into equation 6, 2 V_D

Efficiency of a BTL amplifier
$$= \frac{\frac{2 P_{L}}{2 R_{L}}}{\frac{2 V_{DD} V_{P}}{\pi R_{I}}} = \frac{\pi V_{P}}{4 V_{DD}}$$

Where:

$$V_{P} = \sqrt{2 P_{L} R_{L}}$$

Therefore,

$$\eta_{\text{BTL}} = \frac{\pi \sqrt{2 P_{\text{L}} R_{\text{L}}}}{4 V_{\text{DD}}}$$

P₁ = Power delivered to load P_{SUP}^{-} = Power drawn from power supply V_{LRMS} = RMS voltage on BTL load $R_L = Load$ resistance V_{P}^{-} = Peak voltage on BTL load IDDavg = Average current drawn from the power supply V_{DD} = Power supply voltage η_{BTL} = Efficiency of a BTL amplifier

(5)

(4)

SLOS429 - MAY 2004

Table 2 and Table 3 employ equation (5) to calculate efficiencies for four different output power levels. Note that the efficiency of the amplifier is quite low for lower power levels and rises sharply as power to the load is increased resulting in a nearly flat internal power dissipation over the normal operating range. Note that the internal dissipation at full output power is less than in the half power range. Calculating the efficiency for a specific system is the key to proper power supply design. For a 1-W audio system with 8- Ω loads and a 5-V supply, the maximum draw on the power supply is almost 1.6 W.

A final point to remember about Class-AB amplifiers is how to manipulate the terms in the efficiency equation to the utmost advantage when possible.

A simple formula for calculating the maximum power dissipated, P_{Dmax} , may be used for a differential output application:

$$\mathsf{P}_{\mathsf{Dmax}} = \frac{2\mathsf{V}_{\mathsf{DD}}^2}{\pi^2\mathsf{R}_{\mathsf{L}}} \tag{6}$$

 $\mathsf{P}_{\mathsf{Dmax}}$ for a 5-V, 8- Ω system is 0.64 W.

The maximum ambient temperature depends on the heat sinking ability of the PCB system. The derating factor for the 3 mm x 3 mm DRB package is shown in the dissipation rating table. Converting this to Θ_{JA} :

$$\Theta_{JA} = \frac{1}{\text{Derating Factor}} = \frac{1}{0.0218} = 45.9^{\circ}\text{C/W}$$
 (7)

STRUMENTS www.ti.com

Given Θ_{JA} , the maximum allowable junction temperature, and the maximum internal dissipation, the maximum ambient temperature can be calculated with the following equation. The maximum recommended junction temperature for the TPA6204A1 is 150°C.

$$T_A Max = T_J Max - \Theta_{JA} P_{Dmax}$$
 (8)
= 150 - 45.9(0.64) = 120.6°C

Equation (8) shows that the maximum ambient temperature is 120.6°C (package limited to 85°C) at maximum power dissipation with a 5-V supply.

Table 2 shows that for most applications no airflow is required to keep junction temperatures in the specified range. The TPA6204A1 is designed with thermal protection that turns the device off when the junction temperature surpasses 150°C to prevent damage to the IC. In addition, using speakers with an impedance higher than 8- Ω dramatically increases the thermal performance by reducing the output current.

Output Power (W)	Efficiency (%)	Internal Dissipation (W)	Power From Supply (W)	Max Ambient Temperature (2) (°C)
0.1	27.6	0.262	0.36	85

PCB LAYOUT

It is important to keep the TPA6204A1 external components very close to the TPA6204A1 to limit noise pickup.

8-Pin QFN (DRB) Layout

Use the following land pattern for board layout with the 8-pin QFN (DRB) package. Note that the solder paste should use a hatch pattern to fill solder paste at 50% to ensure that there is not too much solder paste under the package.

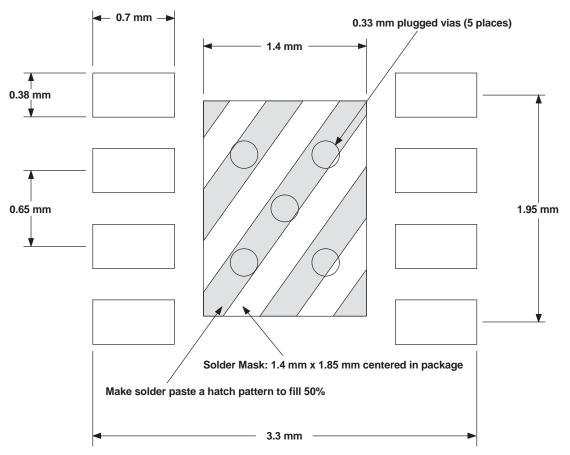

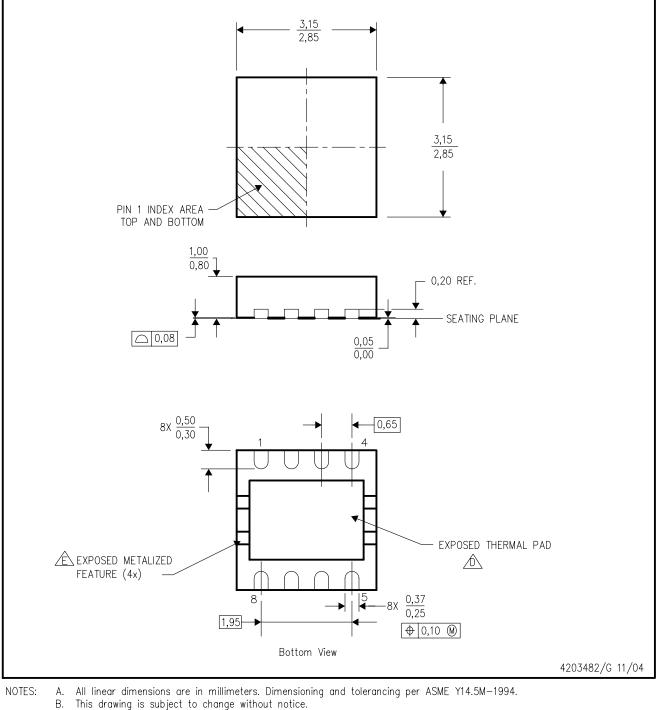

Figure 19. TPA6204A1 8-Pin QFN (DRB) Board Layout (Top View)

DRB (S-PDSO-N8)

PLASTIC SMALL OUTLINE

C. Small Outline No-Lead (SON) package configuration.

The package thermal pad must be soldered to the board for thermal and mechanical performance. See the Product Data Sheet for details regarding the exposed thermal pad dimensions.
