

## 2.75-W FIXED GAIN MONO FILTER-FREE CLASS-D AUDIO POWER AMPLIFIER

### FEATURES

- Maximize Battery Life and Minimize Heat
  - 0.5- $\mu$ A Shutdown Current
  - 3.0-mA Quiescent Current
  - High Efficiency Class-D
    - 88% at 400mW at 8 $\Omega$
    - 80% at 100mW at 8 $\Omega$
- Three Fixed Gain Versions
  - TPA2032D1 has a gain of 2 V/V (6dB)
  - TPA2033D1 has a gain of 3 V/V (9.5dB)
  - TPA2034D1 has a gain of 4 V/V (12dB)
- Only One External Component Required
  - Internal Matched Input Gain and Feedback Resistors for Excellent PSRR and CMRR
  - Optimized PWM Output Stage Eliminates LC Output Filter
  - PSRR (–75 dB) and Wide Supply Voltage (2.5 V to 5.5 V) Eliminates Need for a Dedicated Voltage Regulator
  - Fully Differential Design Reduces RF Rectification and Eliminates Bypass Capacitor
  - CMRR (–69 dB) Eliminates Two Input Coupling Capacitors
- Thermal and Short-Circuit Protection
- Pinout Very Similar to TPA2010D1

- Wafer Chip Scale Packaging (WCSP)
  - NanoFree™ Lead-Free (Pb-Free: YZF)

### APPLICATIONS

- Ideal for Wireless Handsets, PDAs, and other mobile devices

### DESCRIPTION

The TPA2032D1 (2V/V gain), TPA2033D1 (3V/V gain), and TPA2034D1 (4V/V gain) are 2.75-W high efficiency filter-free class-D audio power amplifiers, each in an approximately 1.5-mm  $\times$  1.5-mm wafer chip scale package (WCSP) that requires only one external component. The pinout is the same as the TPA2010D1 except that the external gain setting input resistors required by the TPA2010D1 are integrated into the fixed gain TPA203xD1 family.

Features like –75dB PSRR and improved RF-rectification immunity with a very small PCB footprint (WCSP amplifier plus single decoupling cap) make the TPA203xD1 family ideal for wireless handsets. A fast start-up time of 3.2 ms with minimal pop makes the TPA203xD1 family ideal for PDA applications.

In wireless handsets, the earpiece, speaker phone, and melody ringer can each be driven by a TPA203xD1. The TPA203xD1 family has a low 27- $\mu$ V noise floor, A-weighted.

### APPLICATION CIRCUIT

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

NanoFree is a trademark of Texas Instruments.

These devices have limited built-in ESD protection. The leads should be shorted together or the device placed in conductive foam during storage or handling to prevent electrostatic damage to the MOS gates.

## ORDERING INFORMATION

T <sub>A</sub>	PACKAGE	PART NUMBER	SYMBOL
–40°C to 85°C	Wafer chip scale packaging – Lead free (YZF)	TPA2032D1YZF <sup>(1)</sup>	BPX
–40°C to 85°C	Wafer chip scale packaging – Lead free (YZF)	TPA2033D1YZF <sup>(1)</sup>	BPY
–40°C to 85°C	Wafer chip scale packaging – Lead free (YZF)	TPA2034D1YZF <sup>(1)</sup>	BPZ

(1) The YZF package is only available taped and reeled. To order add the suffix *R* to the end of the part number for a reel of 3000, or add the suffix *T* to the end of the part number for a reel of 250 (e.g. TPA2032D1YZFR).

## ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range unless otherwise noted<sup>(1)</sup>

		TPA2032D1, TPA2033D1, TPA2034D1
V <sub>DD</sub>	Supply voltage	
		In active mode –0.3 V to 6 V In <u>SHUTDOWN</u> mode –0.3 V to 7 V
V <sub>I</sub>	Input voltage	–0.3 V to V <sub>DD</sub> + 0.3 V
	Continuous total power dissipation	See Dissipation Rating Table
T <sub>A</sub>	Operating free-air temperature	–40°C to 85°C
T <sub>J</sub>	Operating junction temperature	–40°C to 125°C
T <sub>stg</sub>	Storage temperature	–65°C to 150°C
ESD	Electro-Static Discharge Tolerance - Human Body Model (HBM) for all pins <sup>(2)</sup>	2KV

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

(2) The output pins Vo– and Vo+ are tolerant to 1.5KV HBM ESD

## RECOMMENDED OPERATING CONDITIONS

		MIN	NOM	MAX	UNIT

### TEST SET-UP FOR GRAPHS

- (1)  $C_1$  was shorted for any common-mode input voltage measurement. All other measurements were taken with a 1- $\mu$ F  $C_1$  (unless otherwise noted).
- (2) A 33- $\mu$ H inductor was placed in series with the load resistor to emulate a small speaker for efficiency measurements.
- (3) The 30-kHz low-pass filter is required, even if the analyzer has an internal low-pass filter. An RC low-pass filter (100 $\Omega$ , 47-nF) is used on each output for the data sheet graphs.

## APPLICATION INFORMATION

### FULLY DIFFERENTIAL AMPLIFIER

The TPA2032D1 is a fully differential amplifier with differential inputs and outputs. The fully differential amplifier consists of a differential amplifier and a common-mode amplifier. The differential amplifier ensures that the amplifier outputs a differential voltage on the output that is equal to the differential input times the gain. The common-mode feedback ensures that the common-mode voltage at the output is biased around  $V_{DD}/2$  regardless of the common-mode voltage at the input. The fully differential TPA2032D1 can still be used with a single-ended input; however, the TPA2032D1 should be used with differential inputs when in a noisy environment, like a wireless handset, to ensure maximum noise rejection.

#### Advantages of Fully Differential Amplifiers

- Input-coupling capacitors not required:
  - The fully differential amplifier allows the inputs to be biased at voltage other than mid-supply. The inputs of the TPA2032D1 can be biased anywhere within the common mode input voltage range listed in the Recommended Operating Conditions table. If the inputs are biased outside of that range, input-coupling capacitors are required.
- Midsupply bypass capacitor,  $C_{(BYPASS)}$ , not required:
  - The fully differential amplifier does not require a bypass capacitor. Any shift in the midsupply affects both positive and negative channels equally and cancels at the differential output.
- Better RF-immunity:
  - GSM handsets save power by turning on and shutting off the RF transmitter at a rate of 217 Hz. The transmitted signal is picked-up on input and output traces. The fully differential amplifier cancels the signal better than the typical audio amplifier.

### COMPONENT SELECTION

Figure 35 shows the TPA2032D1 typical schematic with differential inputs, while Figure 36 shows the TPA2032D1 with differential inputs and input capacitors. Figure 37 shows the TPA2032D1 with a single-ended input.

#### Decoupling Capacitor ( $C_S$ )

The TPA2032D1 is a high-performance class-D audio amplifier that requires adequate power supply decoupling to ensure the efficiency is high and total harmonic distortion (THD) is low. For higher frequency transients, spikes, or digital hash on the line, a good low equivalent-series-resistance (ESR) ceramic capacitor, typically  $1\mu\text{F}$ , placed as close as possible to the device  $V_{DD}$  lead works best. Placing this decoupling capacitor close to the TPA2032D1 is very important for the efficiency of the class-D amplifier, because any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency. For filtering lower-frequency noise signals, a  $10\mu\text{F}$  or greater capacitor placed near the audio power amplifier would also help, but it is not required in most applications because of the high PSRR of this device. Typically, the smaller the capacitor's case size, the lower the inductance and the closer it can be placed to the TPA2032D1.

#### Input Capacitors ( $C_I$ )

The TPA2032D1 does not require input coupling capacitors if the design uses a differential source that is biased within the common-mode input voltage range. That voltage range is listed in the Recommended Operating Conditions table. If the input signal is not biased within the recommended common-mode input range, such as in needing to use the input as a high pass filter, shown in Figure 36, or if using a single-ended source, shown in Figure 37, input coupling capacitors are required. The same value capacitors should be used on both IN+ and IN– for best pop performance.

$$f_c = \frac{1}{(2\pi R_I C_I)} \quad (1)$$

The value of the input capacitor is important to consider as it directly affects the bass (low frequency) performance of the circuit. Speaker response may also be taken into consideration when setting the corner frequency using input capacitors.

### APPLICATION INFORMATION (continued)

Equation 2 is reconfigured to solve for the input coupling capacitance.

$$C_I = \frac{1}{(2\pi R_I f_c)} \quad (2)$$

If the corner frequency is within the audio band, the capacitors should have a tolerance of  $\pm 10\%$  or better, because any mismatch in capacitance causes an impedance mismatch at the corner frequency and below.

For a flat low-frequency response, use large input coupling capacitors (1  $\mu\text{F}$  or larger).

Figure 35. Typical TPA2032D1 Application Schematic With Differential Input for a Wireless Phone

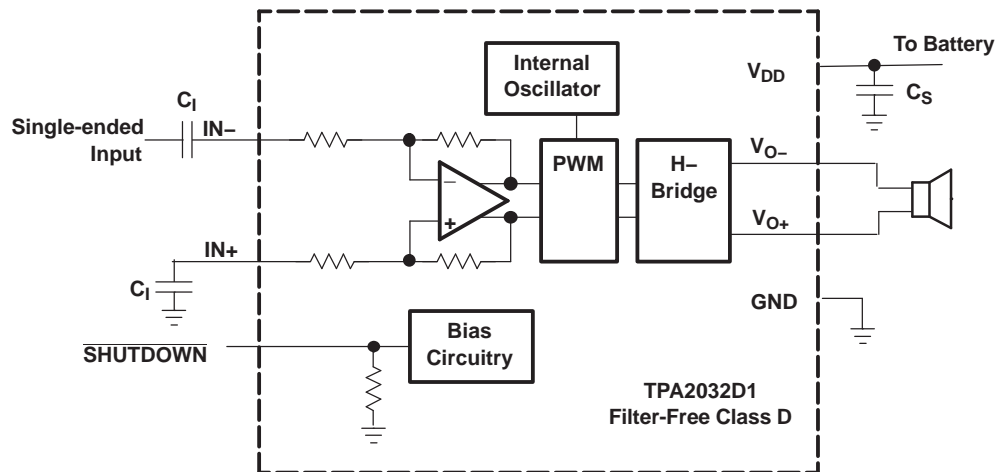

Figure 36. TPA2032D1 Application Schematic With Differential Input and Input Capacitors

**APPLICATION INFORMATION (continued)**

**Figure 37. TPA2032D1 Application Schematic With Single-Ended Input**

**BOARD LAYOUT**

In making the pad size for the WCSP balls, it is recommended that the layout use nonsolder mask defined (NSMD) land. With this method, the solder mask opening is made larger than the desired land area, and the opening size is defined by the copper pad width. [Figure 38](#) and [Table 1](#) show the appropriate diameters for a WCSP layout. The TPA2032D1 evaluation module (EVM) layout is shown in the next section as a layout example.

**Figure 38. Land Pattern Dimensions**

## APPLICATION INFORMATION (continued)

**Table 1. Land Pattern Dimensions**

SOLDER PAD DEFINITIONS	COPPER PAD	SOLDER MASK OPENING	COPPER THICKNESS	STENCIL OPENING	STENCIL THICKNESS
Nonsolder mask defined (NSMD)	275 $\mu\text{m}$ (+0.0, -25 $\mu\text{m}$ )	375 $\mu\text{m}$ (+0.0, -25 $\mu\text{m}$ )	1 oz max (32 $\mu\text{m}$ )	275 $\mu\text{m}$ x 275 $\mu\text{m}$ Sq. (rounded corners)	125 $\mu\text{m}$ thick

### NOTES:

1. Circuit traces from NSMD defined PWB lands should be 75  $\mu\text{m}$  to 100  $\mu\text{m}$  wide in the exposed area inside the solder mask opening. Wider trace widths reduce device stand off and impact reliability.
2. Recommended solder paste is Type 3 or Type 4.
3. Best reliability results are achieved when the PWB laminate glass transition temperature is above the operating range of the intended application.
4. For a PWB using a Ni/Au surface finish, the gold thickness should be less 0.5  $\mu\text{m}$  to avoid a reduction in thermal fatigue performance.
5. Solder mask thickness should be less than 20  $\mu\text{m}$  on top of the copper circuit pattern.
6. Best solder stencil performance is achieved using laser-cut stencils with electro polishing. Use of chemically etched stencils results in inferior solder paste volume control.
7. Trace routing away from WCSP device should be balanced in X and Y directions to avoid unintentional component movement due to solder wetting forces.

### Component Location

Place all the external components very close to the TPA2032D1. Placing the decoupling capacitor,  $C_S$ , close to the TPA2032D1 is important for the efficiency of the class-D amplifier. Any resistance or inductance in the trace between the device and the capacitor can cause a loss in efficiency.

### Trace Width

Recommended trace width at the solder balls is 75  $\mu\text{m}$  to 100  $\mu\text{m}$  to prevent solder wicking onto wider PCB traces. [Figure 39](#) shows the layout of the TPA2032D1 evaluation module (EVM).

For high current pins ( $V_{DD}$ , GND  $V_{O+}$ , and  $V_{O-}$ ) of the TPA2032D1, use 100- $\mu\text{m}$  trace widths at the solder balls and at least 500- $\mu\text{m}$  PCB traces to ensure proper performance and output power for the device.

For input pins (IN $^-$ , IN $^+$ , and  $\overline{\text{SHUTDOWN}}$ ) of the TPA2032D1, use 75- $\mu\text{m}$  to 100- $\mu\text{m}$  trace widths at the solder balls. IN $^-$  and IN $^+$  traces need to run side-by-side to maximize common-mode noise cancellation.

## WHEN TO USE AN OUTPUT FILTER

Design the TPA2032D1 without an output filter if the traces from the amplifier to the speaker are short. Wireless handsets and PDAs are great applications for this class-D amplifier to be used without an output filter.

The TPA2032D1 passed FCC- and CE-radiated emissions testing with no shielding with speaker trace wires 100 mm long or less. For longer speaker trace wires, a ferrite bead can often be used in the design if failing radiated emissions testing without an LC filter; and, the frequency-sensitive circuit is greater than 1 MHz. If choosing a ferrite bead, choose one with high impedance at high frequencies, but very low impedance at low frequencies. The selection must also take into account the currents flowing through the ferrite bead. Ferrites can begin to lose effectiveness at much lower than rated current values. Please see the EVM User's Guide for components used successfully by TI.

Figure 40 shows a typical ferrite-bead output filter.
