

- 1-A Current Capability Per Channel
- 45-V Inductive Switching Voltage Capability
- Current Sink Inputs Compatible With TTL or CMOS Devices
- Output Clamp Diodes for Inductive Transient Protection
- Independent Thermal Shutdown Protection
- Overvoltage Shutdown Protection
- Independent Channel Current Limit
- Error Sensing
- Extended Temperature Range of -40°C to 125°C

description

The TPIC2404 is a monolithic high-voltage high-current quadruple low-side switch especially designed for driving from low-level logic to peripheral loads such as relays, solenoids, motors, lamps, and other high-voltage high-current loads. The high-efficiency power switch is optimized for applications where a very rugged power switch is required. The device tolerates power supply transients and reverse battery conditions up to 13 V.

The TPIC2404 features four inverting open-collector outputs controlled by a common-enable input. When ENABLE is low, the outputs are disabled. An error-sensing circuit monitors load and device faults. When an error is sensed, the $\overline{\text{FAULT}}$ output goes to a low state. In addition, the device features on-board V_{CC} overvoltage and thermal overload protection circuits, and the outputs are current limit protected.

absolute maximum ratings over operating temperature range (unless otherwise noted)

Supply voltage range, V_{CC} (see Note 1)	–13 V to 24 V
Input voltage range, V_I	–0.6 V to 7 V
Output voltage range, V_O (see Note 2)	–0.6 V to 45 V
Output sustaining voltage, $V_{O(sust)}$	45 V
Continuous output sink current (repetitive, $t_w < 8$ ms), I_{OL} (see Note 3)	1.5 A
Output clamp-diode voltage, V_{OK}	45 V
Continuous total dissipation at (or below) 25°C case temperature (see Note 4)	50 W
Operating case or virtual junction temperature range	–55°C to 150°C
Storage temperature range	–65°C to 150°C
Lead temperature 1,6 mm (1/16 inch) from case for 10 seconds	260°C

- NOTES: 1. All voltage values are with respect to network GND.
 2. For a fault condition to be valid, the output voltage needs to be a minimum of 7 V.
 3. Output sink current is limited by the overcurrent limit.
 4. For operation above 25°C free-air or case temperature, refer to Figures 1 and 2. To avoid exceeding the design maximum virtual junction temperature, these ratings should not be exceeded. Due to variations in individual device electrical characteristics and thermal resistance, the built-in thermal overload protection can be activated at power levels slightly above or below rated dissipation.
