1.3 GHz bidirectional I²C-bus controlled synthesizer

TSA5518M

FEATURES

- Complete 1.3 GHz single chip system
- Low power 5 V, 40 mA
- I²C-bus programming
- One pin crystal oscillator
- In-lock flag
- Varicap drive disable
- Low radiation
- Address selection for picture in picture (PIP), DBS tuner, and so on
- 5-level A/D converter
- 7 bus-controlled ports (4 open-collector outputs and 3 emitter follower outputs), 1 bidirectional port
- Power-down flag
- Mixer/oscillator bandswitch output
- Available in SSOP20 package.

APPLICATIONS

- TV tuners and front-ends
- VCR tuners.

GENERAL DESCRIPTION

The device is a single chip PLL frequency synthesizer designed for TV tuning systems. Control data is entered via the I²C-bus; five serial bytes are required to address the device, select the oscillator frequency, program the 7 output ports and set the charge-pump current.

The output port P6 is combined with an A/D converter input. Digital information concerning this port can be read out of the SDA line (one status byte) during a READ operation. A flag is set when the loop is 'in-lock' and is read during a READ operation. The device has one fixed I²C-bus address, programmed by applying a specific voltage on AS input. The phase comparator operates at 7.8125 kHz when a 4 MHz crystal is used. The device provides a bandswitch output to select the bands of the mixer/oscillator ICs TDA5330, TDA5630A except TDA5630/C1 and TDA5730 with the appropriate voltage level.

QUICK REFERENCE DATA

SYMBOL	PARAMETER	CONDITIONS	MIN.	TYP.	MAX.	UNIT

PD	20	charge-pump output (PD)

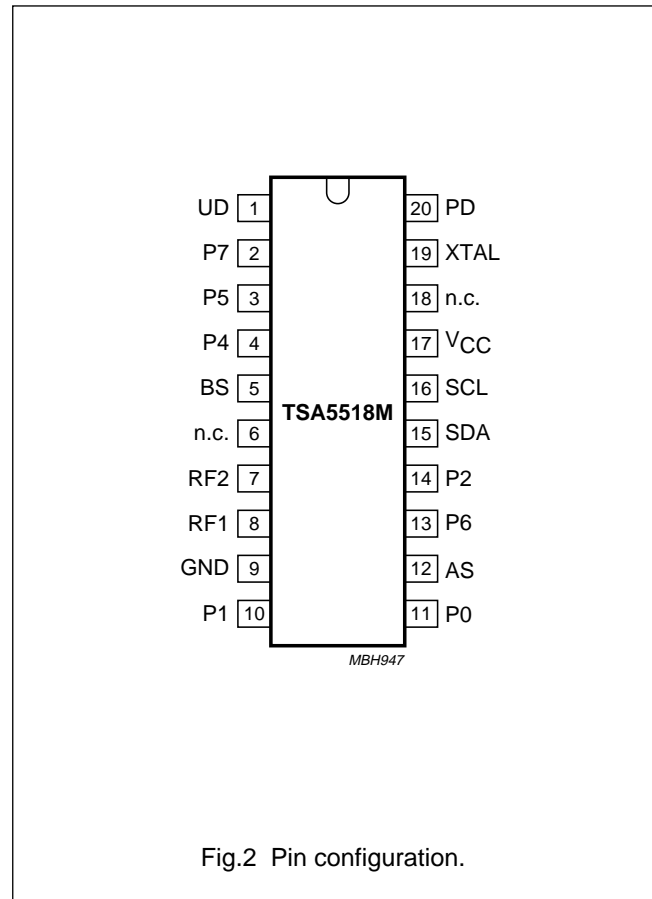

Fig.2 Pin configuration.

FUNCTIONAL DESCRIPTION

The device is controlled via the two wire I²C-bus. For programming, there is one module address (7 bits) and the R/W bit for selecting READ or WRITE mode.

Write mode

The write data format is summarized in Table 1. After the address transmission (first byte), data bytes can be sent to the device. Four data bytes are needed to fully program the device. The bus transceiver has an auto increment facility which permits the programming of the device within one single transmission (address byte + 4 data bytes). The device can also be partially programmed on the condition that the first data byte following the address is byte 2 or 4. The meaning of the bits in the data bytes is given in Table 3. The first bit of the first data byte transmitted indicates whether frequency data (first bit = 0)

or charge pump and port information (first bit = 1) will follow. Until an I²C-bus STOP condition is sent by the controller, additional data bytes can be entered without the need to re-address the device. This allows a smooth frequency sweep for fine tuning or AFC purpose. At power-on the ports are set to the high-impedance state (open-collector outputs) or at the HIGH level (emitter follower outputs). The bandswitch output BS provides a voltage output suitable for the band selection input of mixer/oscillator ICs TDA5330, TDA5630A and TDA5730. It is controlled by B1 and B0 bits or P7, P5 and P4 bits depending on the BSC bit (see Tables 1 to 4). The 7.8125 kHz reference frequency is obtained by dividing the output of the 4 MHz crystal oscillator by 512. Because the input of UHF/VHF signal is first divided-by-8 the step size is 62.5 kHz. A 3.2 MHz crystal can offer step size of 50 kHz.

1.3 GHz bidirectional I²C-bus controlled synthesizer

TSA5518M

Read mode

The read data format is summarised in Table 5. Data can be read out of the device by setting the R/W bit to logic 1. After the slave address has been recognized, the device generates an acknowledge pulse and the status word is transferred on the SDA line (MSB first). Data is valid on the SDA line during a HIGH of the SCL clock signal. A second data byte can be read out of the device if the processor generates an acknowledge on the SDA line. End of transmission will occur if no acknowledge from the processor occurs. The device will then release the data line to allow the processor to generate a STOP condition. When the port P6 is used as input, it must be programmed

in its high-impedance state. The POR flag (Power-on reset) is set to logic 1 when V_{CC} goes below 3 V and at power-on. It is reset when an end of data is detected by the device (end of a READ sequence). Control of the loop is made possible with the in-lock flag FL which indicates (FL = 1) when the loop is phase-locked. A built-in % level A/D converter is available on I/O port P6. This converter can be used to feed AFC information to the controller from the IF section of the television as illustrated in the typical application circuit in Fig.2. The relationship between bit A2, A1 and A0 and the input voltage on port P6 is given in Table 6.

Table 5 Read data format

BYTE	DESCRIPTION	MSB							LSB		ACKNOWLEDGE
1	address	1	1	0	0	0	0	MA1 ⁽¹⁾	MA0 ⁽¹⁾	1	LOW from device
2, ..	status byte(s)	POR ⁽²⁾	FL ⁽³⁾	0	0	0	0	A2 ⁽⁴⁾	A1 ⁽⁴⁾	A0 ⁽⁴⁾	note 5

Notes

- See Table 7.
- POR: Power-on reset flag. (POR = 1 on power-on).
- FL: in lock flag (FL = 1 when the loop is phase-locked).
- A2, A1, A0: digital outputs of the 5 level A/D converter (see Table 6). Accuracy is 1/2 LSB. MSB is transmitted first.
- Upon an acknowledge pulse from the controller, the device transfers the status byte again. If no acknowledge pulse from the controller is received, data read is terminated.

Table 6 A/D converter levels

Accuracy on the switching levels is $\pm 0.02V_{CC}$.

VOLTAGE APPLIED ON PIN P6	A2	A1	A0
0.6V _{CC} to 5.5 V	1	0	0
0.45V _{CC} to 0.6V _{CC}	0	1	1
0.3V _{CC} to 0.45V _{CC}	0	1	0
0.15V _{CC} to 0.3V _{CC}	0	0	1
0 to 0.15V _{CC}	0	0	0

Table 7 Address selection

VOLTAGE APPLIED ON PIN AS	MA1	MA0
0 to 0.1V _{CC}	0	0
always valid	0	1
0.4 to 0.6V _{CC}	1	0
0.9V _{CC} to V _{CC}	1	1

Address selection

The module address contains programmable address bits (MA1 and MA0) which offer the possibility of having several synthesizers (up to 3) in one system by applying a specific voltage on AS input. The relationship between MA1 and MA0 and the input voltage on AS input is given in Table 7.

Frequency lock flag (FL) definition

When the FL flag is logic 1, the maximum frequency deviation dF from stable frequency can be expressed as:

$$df = \pm \frac{K_{VCO}}{K_O} \times I_{CP} \times \frac{C1 + C2}{C1 \times C2} \text{ with:}$$

K_{VCO} = oscillator slope (Hz/V)

I_{CP} = charge pump current (A)

K_O = 4×10^6

C1, C2 = loop filter capacitors.

SOLDERING

Introduction

There is no soldering method that is ideal for all IC packages. Wave soldering is often preferred when through-hole and surface mounted components are mixed on one printed-circuit board. However, wave soldering is not always suitable for surface mounted ICs, or for printed-circuits with high population densities. In these situations reflow soldering is often used.

This text gives a very brief insight to a complex technology. A more in-depth account of soldering ICs can be found in our *"IC Package Databook"* (order code 9398 652 90011).

Reflow soldering

Reflow soldering techniques are suitable for all SSOP packages.

Reflow soldering requires solder paste (a suspension of fine solder particles, flux and binding agent) to be applied to the printed-circuit board by screen printing, stencilling or pressure-syringe dispensing before package placement.

Several techniques exist for reflowing; for example, thermal conduction by heated belt. Dwell times vary between 50 and 300 seconds depending on heating method. Typical reflow temperatures range from 215 to 250 °C.

Preheating is necessary to dry the paste and evaporate the binding agent. Preheating duration: 45 minutes at 45 °C.

Wave soldering

Wave soldering is **not** recommended for SSOP packages. This is because of the likelihood of solder bridging due to closely-spaced leads and the possibility of incomplete solder penetration in multi-lead devices.

If wave soldering cannot be avoided, the following conditions must be observed:

- **A double-wave (a turbulent wave with high upward pressure followed by a smooth laminar wave) soldering technique should be used.**
- **The longitudinal axis of the package footprint must be parallel to the solder flow and must incorporate solder thieves at the downstream end.**

Even with these conditions, only consider wave soldering SSOP packages that have a body width of 4.4 mm, that is SSOP16 (SOT369-1) or SSOP20 (SOT266-1).

During placement and before soldering, the package must be fixed with a droplet of adhesive. The adhesive can be applied by screen printing, pin transfer or syringe dispensing. The package can be soldered after the adhesive is cured.

Maximum permissible solder temperature is 260 °C, and maximum duration of package immersion in solder is 10 seconds, if cooled to less than 150 °C within 6 seconds. Typical dwell time is 4 seconds at 250 °C.

A mildly-activated flux will eliminate the need for removal of corrosive residues in most applications.

Repairing soldered joints

Fix the component by first soldering two diagonally-opposite end leads. Use only a low voltage soldering iron (less than 24 V) applied to the flat part of the lead. Contact time must be limited to 10 seconds at up to 300 °C. When using a dedicated tool, all other leads can be soldered in one operation within 2 to 5 seconds between 270 and 320 °C.

DEFINITIONS

Data sheet status	
Objective specification	This data sheet contains target or goal specifications for product development.
Preliminary specification	This data sheet contains preliminary data; supplementary data may be published later.
Product specification	This data sheet contains final product specifications.
Limiting values	
Limiting values given are in accordance with the Absolute Maximum Rating System (IEC 134). Stress above one or more of the limiting values may cause permanent damage to the device. These are stress ratings only and operation of the device at these or at any other conditions above those given in the Characteristics sections of the specification is not implied. Exposure to limiting values for extended periods may affect device reliability.	
Application information	
Where application information is given, it is advisory and does not form part of the specification.	

LIFE SUPPORT APPLICATIONS

These products are not designed for use in life support appliances, devices, or systems where malfunction of these products can reasonably be expected to result in personal injury. Philips customers using or selling these products for use in such applications do so at their own risk and agree to fully indemnify Philips for any damages resulting from such improper use or sale.

PURCHASE OF PHILIPS I²C COMPONENTS

Purchase of Philips I²C components conveys a license under the Philips' I²C patent to use the components in the I²C system provided the system conforms to the I²C specification defined by Philips. This specification can be ordered using the code 9398 393 40011.
