TVP7000

TRIPLE 8/10-BIT, 150/110 MSPS, VIDEO AND GRAPHICS DIGITIZER WITH ANALOG PLL

FEATURES

- **Analog Channels**
  - **−6 dB to 6 dB Analog Gain**
  - **Analog Input MUXs**
  - **Auto Video Clamp**
  - **Three Digitizing Channels, Each With Independently Controllable Clamp, PGA, and ADC**
  - **Clamping: Selectable Clamping Between Bottom Level and Mid-level**
  - **Offset: 1024-Step Programmable RGB or YPbPr Offset Control**
  - **PGA: 8-Bit Programmable Gain Amplifier**
  - **ADC: 8/10-Bit 150/110 MSPS A/D Converter**
  - **Automatic Level Control Circuit**
  - **Composite Sync: Integrated Sync-on-Green Extraction From GreenLuminance Channel**
  - **Support for DC and AC-Coupled Input Signals**
- **PLL**
  - **Fully Integrated Analog PLL for Pixel Clock Generation**
  - **12-150 MHz Pixel Clock Generation From HSYNC Input**
  - **Adjustable PLL Loop Bandwidth for Minimum Jitter**
  - **5-Bit Programmable Subpixel Accurate Positioning of Sampling Phase**
- **Output Formatter**
  - **Support for RGB/YCbCr 4:4:4 and YCbCr 4:2:2 Output Modes to Reduce Board Traces**
  - **Dedicated DATACLK Output for Easy Latching of Output Data**
- **System**
  - **Industry-Standard Normal/Fast I²C Interface With Register Readback Capability**
  - **Space-Saving TQFP-100 Pin Package**
  - **Thermally-Enhanced PowerPAD™ Package for Better Heat Dissipation**

APPLICATIONS

- **LCD TV/Monitors/Projectors**
- **DLP TV/Projectors**
- **PDP TV/Monitors**
- **PCTV Set-Top Boxes**
- **Digital Image Processing**
- **Video Capture/Video Editing**
- **Scan Rate/Image Resolution Converters**
- **Video Conferencing**
- **Video/Graphics Digitizing Equipment**

DESCRIPTION

TVP7000 is a complete solution for digitizing video and graphic signals in RGB or YPbPr color spaces. The device supports pixel rates up to 150 MHz. Therefore, it can be used for PC graphics digitizing up to the VESA standard of SXGA (1280 × 1024) resolution at 75 Hz screen refresh rate, and in video environments for the digitizing of digital TV formats, including HDTV up to 1080p. TVP7000 can be used to digitize CVBS and S-Video signal with 10-bit ADCs.

The TVP7000 is powered from 3.3-V and 1.8-V supply and integrates a triple high-performance A/D converter with clamping functions and variable gain, independently programmable for each channel. The clamping timing window is provided by an external pulse or can be generated internally. The TVP7000 includes analog slicing circuitry on the Y or G input to support sync-on-luminance or sync-on-green extraction. In addition, TVP7000 can extract discrete HSYNC and VSYNC from composite sync using a sync slicer.
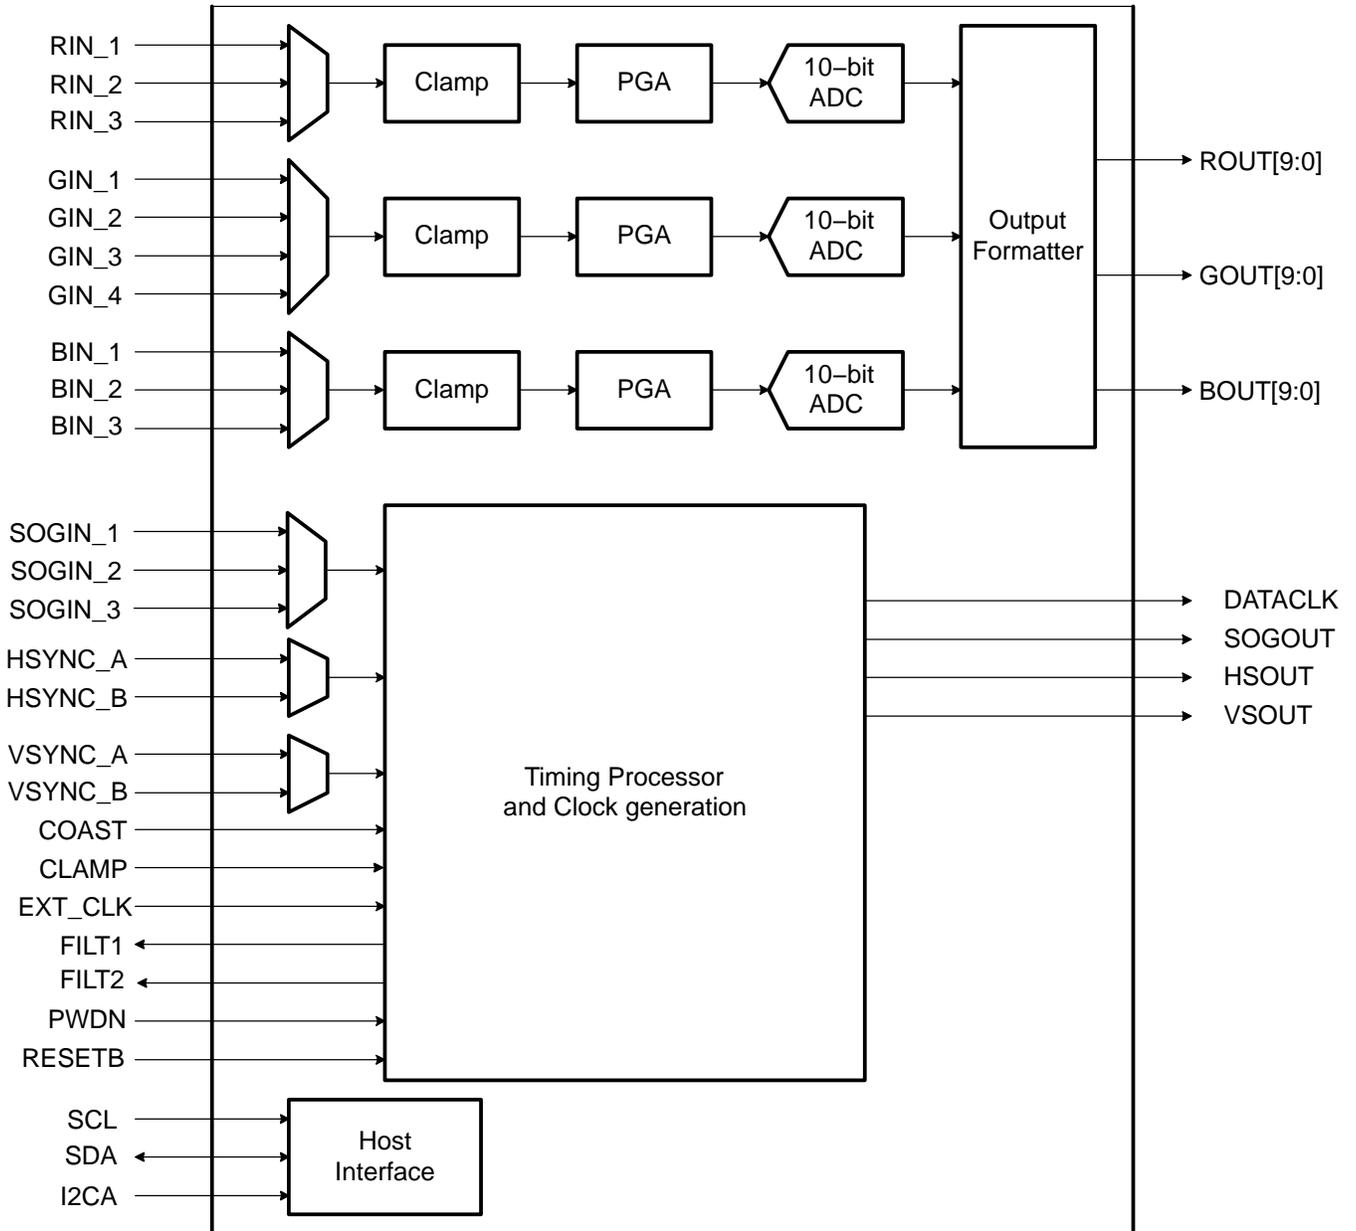

TVP7000 also contains a complete analog PLL block to generate a pixel clock from the HSYNC input. Pixel clock output frequencies range from 12 MHz to 150 MHz.

All programming of the part is done via an industry-standard I²C interface, which supports both reading and writing of register settings. The TVP7000 is available in a space-saving TQFP 100-pin PowerPAD package.

TERMINAL FUNCTIONS

TERMINAL		I/O	DESCRIPTION
NAME	**NO.**		
ANALOG VIDEO			
RIN_1	11	I	Analog video input for R/Pr 1
RIN_2	10	I	Analog video input for R/Pr 2
RIN_3	9	I	Analog video input for R/Pr 3
GIN_1	2	I	Analog video input for G/Y 1
GIN_2	100	I	Analog video input for G/Y 2
GIN_3	98	I	Analog video input for G/Y 3
GIN_4	96	I	Analog video input for G/Y 4
BIN_1	18	I	Analog video input for B/Pb 1
BIN_2	17	I	Analog video input for B/Pb 2
BIN_3	16	I	Analog video input for B/Pb 3
			The inputs must be AC coupled. The recommended coupling capacitor is 0.1 μF. Unused analog inputs should be connected to ground using a 10 nF capacitor.
CLOCK SIGNALS			
DATACLK	28	O	Data clock output
EXT_CLK	80	I	External clock input for free running mode
TEST	22	O	Internal 5 MHz clock output, coast output, high-Z, or SOG output
DIGITAL VIDEO			
ROUT [9:0]	55–59, 61–65	O	Digital video output of R/Cr, ROUT [9] is MSB.
GOUT [9:0]	43-52	O	Digital video output of G/Y, GOUT [9] is MSB.
BOUT [9:0]	29-38	O	Digital video output of B/Cb, BOUT [9] is MSB. For a 4:2:2 mode BOUT outputs CbCr data.
			Unused outputs can be left unconnected.
MISCELLANEOUS SIGNALS			
PWDN	70	I	Power down input. 1: Power down 0: Normal mode
RESETB	71	I	Reset input, active low
TMS	72	I	Test Mode Select input. Used to enable JTAG test mode. Active high. Normal mode, this terminal should be connected to a ground.
FILT1	87	O	External filter connection for PLL. The recommended capacitor is 0.1 μF. see Figure 4
FILT2	88	O	External filter connection for PLL. The recommended capacitor is 4.7 nF. See Figure 4
HOST INTERFACE			
I2C A	73	I	I2C Address input
SCL	74	I	I2C Clock input
SDA	75	I/O	I2C Data bus
POWER SUPPLIES			
NSUB	21, 91	I	Substrate ground. Connect to analog ground.
A33VDD	13, 14, 93, 94	I	Analog power. Connect to 3.3 V.
A33GND	12, 15, 92, 95	I	Analog 3.3 V return. Connect to Ground.
A18GND	3, 5, 8, 20	I	Analog 1.8V return. Connect to Ground
A18VDD	4, 6, 7, 19	I	Analog power. Connect to 1.8 V.
PLL_A18VDD	84, 85	I	PLL analog power. Connect to 1.8 V.
PLL_F	89	I	PLL filter internal supply connection
PLL_A18GND	83, 86, 90	I	PLL analog power return. Connect to Ground.
GND	40, 68	I	Digital return. Connect to Ground.
DVDD	39, 69	I	Digital power. Connect to 1.8 V
IOGND	27, 42, 54, 60, 67	I	Digital power return. Connect to Ground.
IOVDD	26, 41, 53, 66	I	Digital power. Connect to 3.3 V or less for reduced noise.
SYNC SIGNALS			
CLAMP	76	I	External Clamp input. Unused inputs can be connected to ground.
COAST	77	I	External PLL COAST signal input. Unused inputs can be connected to ground

TERMINAL FUNCTIONS (continued)

TERMINAL		I/O	DESCRIPTION
NAME	NO.		
VSYNC_A	78	I	Vertical sync input A
VSYNC_B	79	I	Vertical sync input B. Unused inputs can be connected to ground.
HSYNC_A	81	I	Horizontal Sync input A
HSYNC_B	82	I	Horizontal Sync input B. Unused inputs can be connected to ground.
SOGIN1	1	I	Sync-on-green input 1
SOGIN2	99	I	Sync-on-green input 2
SOGIN3	97	i	Sync-on-green input 3. Unused inputs should be connected to ground using a 10 nF capacitor.
VSOUT	23	O	Vertical sync output
HSOUT	24	O	Horizontal sync output
SOGOUT	25	O	Sync-on-green slicer output

ABSOLUTE MAXIMUM RATINGS

over operating free-air temperature range (unless otherwise noted)[1]

			UNIT
Supply voltage range	IOVDD to IOGND		−0.5 V to 4.5 V
	DVDD to GND		−0.5 V to 2.3 V
	PLL_A18VDD to PLL_A18GND and A18VDD to A18GND		−0.5 V to 2.3 V
	A33VDD to A33GND		− 0.5 V to 4.5 V
Digital input voltage range	VI to GND		−0.5 V to 4.5 V
Analog input voltage range	AI to A33GND		−0.2 V to 2.3 V
Digital output voltage range	VO to GND		−0.5 V to 4.5 V
TA	Operating free-air temperature		0°C to 70°C
Tstg	Storage temperature		−65°C to 150°C

(1) Stresses beyond those listed under *absolute maximum ratings* may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under *recommended operating conditions* is not implied. Exposure to absolute–maximum–rated conditions for extended periods may affect device reliability.

RECOMMENDED OPERATING CONDITIONS

over operating free-air temperature range, T_A = 0°C to 70°C (unless otherwise noted)

TVP7000

FUNCTIONAL DESCRIPTION

Analog Channel

The TVP7000 contains three identical analog channels that are independently programmable. Each channel consists of a clamping circuit, a programmable gain amplifier, automatic offset control and an A/D converter.

Analog Input Switch Control

TVP7000 has 3 analog channels that accept up to 10 video inputs. The user can configure the internal analog video switches via the I2C interface. The 10 analog video inputs can be used for different input configurations some of which are:

- Up to 10 selectable individual composite video inputs
- Up to 2 selectable RGB graphics inputs
- Up to 3 selectable YPbPr video HD/SD inputs

The input selection is performed by the input select register at I^{2}C subaddress 0×19 and 0×1A (see Input Mux Select 1 and Input Mux Select 2)

Analog Input Clamping

An internal clamping circuit restores the AC-coupled video/graphic signal to a fixed DC level. The clamping circuit provides line-by-line restoration of the signal black level to a fixed DC reference voltage. The selection between bottom and mid level clamping is performed by I^{2}C subaddress 0×10 (see Sync On_Green Threshold)

The internal clamping time can be adjusted by I^{2}C clamp start and width registers at subaddress 0×05 and 0×06 (see Clamp Start and Clamp Width)

Programmable Gain Amplifier (PGA)

The TVP7000 PGA can scale a signal with a voltage-input compliance of 0.5-Vpp to 2-Vpp to a full-scale 10-bit A/D output code range. A 4-bit code sets the coarse gain (Red Coarse Gain, Green Coarse Gain, Blue Coarse Gain) with individual adjustment per channel. Minimum gain corresponds to a code 0×0 (2-Vpp full-scale input, −6 dB gain) while maximum gain corresponds to code 0×F (0.5-Vpp full-scale, +6 dB gain). TVP7000 also has 8-bit fine gain control (Red Fine Gain, Green Fine Gain, Blue Fine Gain) for RGB independently ranging from 1 to 2. For a normal PC graphics input, the fine gain will be used mostly.

Programmable Offset Control and Automatic Level Control (ALC)

The TVP7000 supports a programmable offset control for RGB independently. A 6-bit code sets the coarse offset (Red Coarse Offset, Green Coarse Offset, Blue Coarse Offset) with individual adjustment per channel. The coarse offset ranges from −32 LSB to +31 LSB. The coarse offset registers apply before the ADC. A 10-bit fine offset registers (Red Fine Offset, Green Fine Offset, Blue Fine Offset) apply after the ADC. The fine offset ranges from −512 LSB to +511 LSB.

ALC circuit maintains the level of the signal to be set at a value which is programmed at fine offset I^{2}C register. It consists of pixel averaging filter and feedback loop. This ALC function can be enabled or disabled by I^{2}C register address at 0×26. ALC circuit needs a timing pulse generated internally but user should program the position properly. The ALC pulse must be positioning after the clamp pulse. The position of ALC pulse is controlled by ALC placement I^{2}C register at address 0×31. This is available only for internal ALC pulse timing. For external clamp, the timing control of clamp is not applicable so the ALC pulse control is also not applicable. Therefore it is suggested to keep the external clamp pulse as long as possible. ALC is applied as same position of external clamp pulse.

A/D Converters

All ADCs have a resolution of 10-bits and can operate up to 150 MSPS. All A/D channels receive an identical clock from the on-chip phase-locked loop (PLL) at a frequency between 12 MHz and 150 MHz. All ADC reference voltages are generated internally. Also the external sampling clock can be used.

Analog PLL

The analog PLL generates a high-frequency internal clock used by the ADC sampling and data clocking out to derive the pixel output frequency with programmable phase. The reference signal for this PLL is the horizontal sync signal supplied on the HSYNC input or from extracted horizontal sync of sync slicer block for embedded sync signals. The analog PLL consisted of phase detector, loop filter, voltage controlled oscillator (VCO), divider and phase select. The analog block diagram is shown at Figure 3.
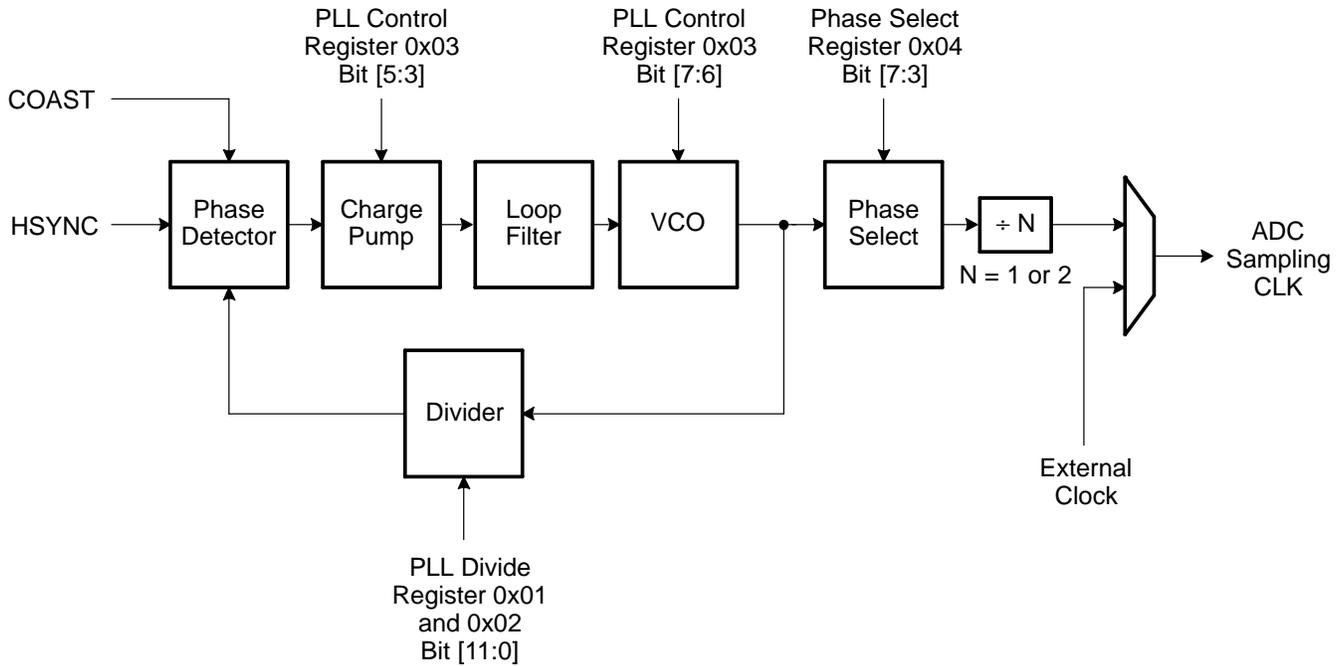

Figure 3. PLL Block Diagram

The COAST signal is used to allow the PLL to keep running at the same frequency, in the absence of the incoming HSYNC signal or disordered HSYNC period. This is useful during the vertical sync period, or any other time that the HSYNC is not available.

There are several PLL controls to produce the correct sampling clock. The 12-bit divider register is programmable to select exact multiplication number to generate the pixel clock in the range of 12 MHz to 150 MHz. The 3-bit loop filter current control register is to control the charge pump current that drives the low-pass loop filter. The applicable current values are listed in the Table 1.

The 2-bit VCO range control is to improve the noise performance of the TVP7000. The frequency ranges for the VCO are shown in Table 1. The phase of the PLL generated clock can be programmed in 32 uniform steps over a single clock period (360/32=11.25 degrees phase resolution) so that the sampling phase of the ADC can be accurately controlled.

In addition to sourcing the ADC channel clock from the PLL, an external pixel clock can be used (from pin 80). The PLL characteristics are determined by the loop filter design, by the PLL charge pump current, and by the VCO range setting. The loop filter design is shown in Figure 4. Supported settings of VCO range and charge pump current for VESA standard display modes are listed in Table 1.
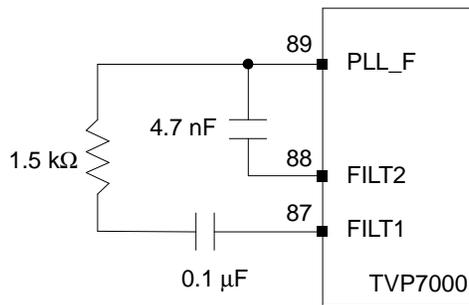

Figure 4. PLL Loop Filter

Sync Slicer

TVP7000 includes a circuit that compares the input signal on Green channel to a level 150mV (typical value) above the clamped level (sync tip). The slicing level is programmable by I^{2}C register subaddress at 0x10. The digital output of the composite sync slicer is available on the SOGOUT pin.

Sync Separator

The sync separator automatically extracts VSYNC and HSYNC from the sliced composite sync input supplied at the SOG input. The G or Y input containing the composite sync must be AC coupled to the SOG input pin using a 10-nF capacitor. Support for PC graphics, SDTV, and HDTV up to 1080p is provided.
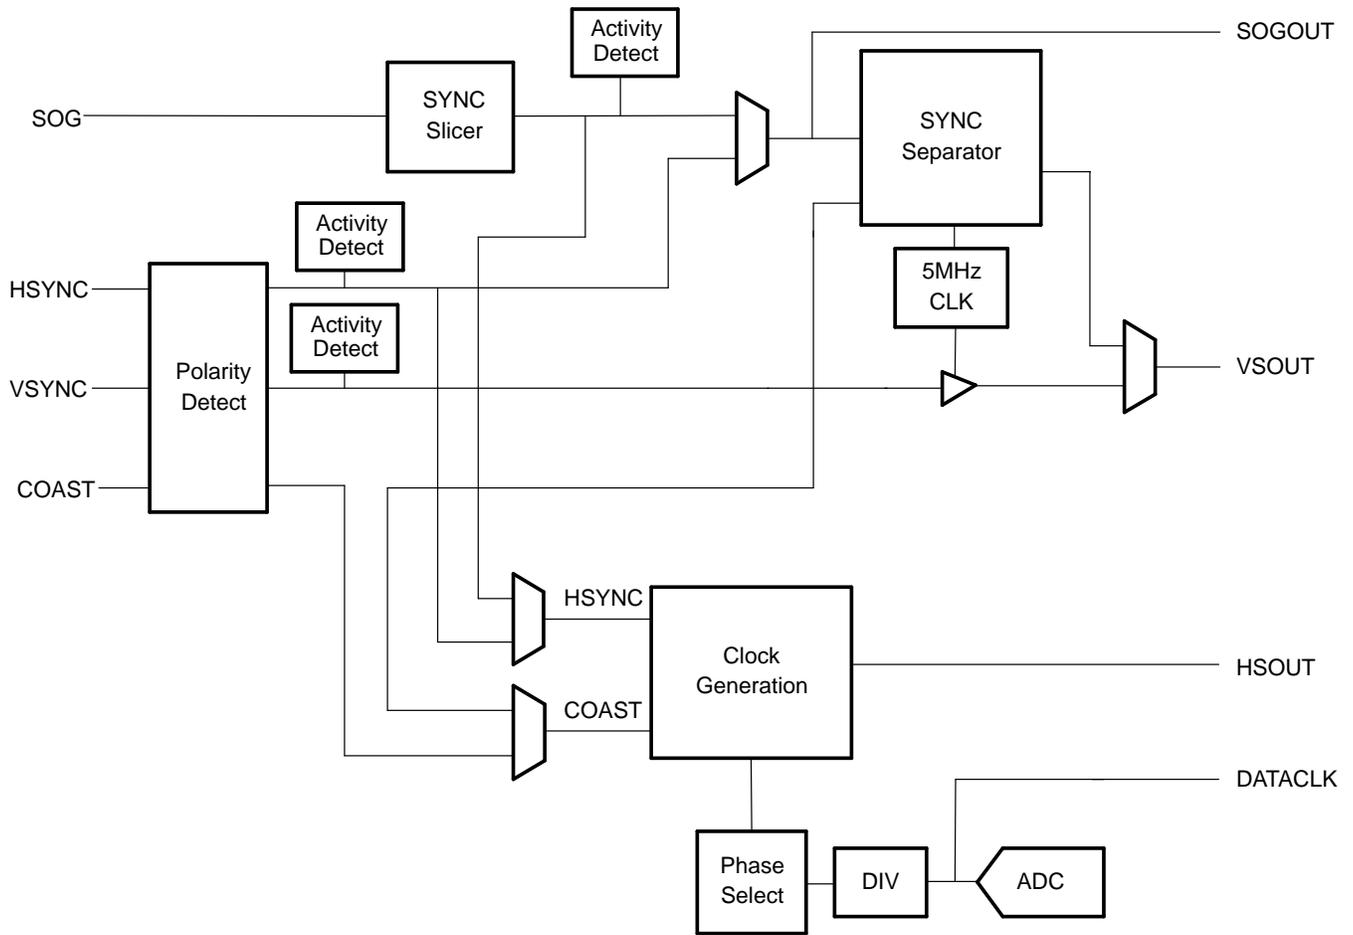

Figure 5. Sync Processing

Timing

The TVP7000 supports RGB/YCbCr 4:4:4 and YCbCr 4:2:2 modes. Output timing is shown in Figure 6. All timing diagrams are shown for operation with internal PLL clock at phase 0. For a 4:2:2 mode, CbCr data outputs at BOUT[9:0] pins.

Figure 6. Output Timing Diagram

I^{2}C Host Interface

Communication with the TVP7000 device is via an I^{2}C host interface. The I^{2}C standard consists of two signals, serial input/output data (SDA) line and input clock line (SCL), which carry information between the devices connected to the bus. A third signal (I^{2}CA) is used for slave address selection. Although an I^{2}C system can be multi-mastered, the TVP7000 can function as a slave device only.

Since SDA and SCL are kept open-drain at logic high output level or when the bus is not driven, the user should connect SDA and SCL to a positive supply voltage via a pull up resistor on the board. SDA is implemented bi-directional. The slave addresses select, terminal 73 (I^{2}CA), enables the use of two TVP7000 devices tied to the same I^{2}C bus since it controls the least significant bit of the I^{2}C device address

Table 2. I^{2}C Host Interface Terminal Description

SIGNAL	TYPE	DESCRIPTION
I^{2}C A	I	Slave address selection
SCL	I	Input clock line
SDA	I/O	Input/output data line

Reset and I^{2}C Bus Address Selection

TVP7000 can respond to two possible chip addresses. The address selection is made at reset by an externally supplied level on the I^{2}C A pin. The TVP7000 device samples the level of terminal 73 at power- up or at the trailing edge of RESETB and configures the I^{2}C bus address bit A0. The I^{2}C A terminal has an internal pull-down resistor to pull the terminal low to set a zero.

Table 3. I^{2}C Host Interface Device Addresses

A6	A5	A4	A3	A2	A1	A0 (I^{2}C A)	R/W	HEX
1	0	1	1	1	0	0 (default)	1/0	B9/B8
1	0	1	1	1	0	1 [(1)]	1/0	BB/BA

(1) If terminal 73 strapped to DVDD via a 2.2 kΩ resistor, I^{2}C device address A0 is set to 1.

I^{2}C Operation

Data transfers occur utilizing the following illustrated formats.

S	10111000	ACK	subaddress	ACK	send data	ACK	P

Read from I^{2}C control registers

S	10111000	ACK	subaddress	ACK	S	10111001	ACK	receive data	NAK	P

S =	I^{2}C Bus Start condition
P =	I^{2}C Bus Stop condition
ACK =	Acknowledge generated by the slave
NAK =	Acknowledge generated by the master, for multiple byte read master with ACK each byte except last byte
Subaddress =	Subaddress byte
Data =	Data byte, if more than one byte of DATA is transmitted (read and write), the subaddress pointer is automatically incremented
I^{2}C bus address =	Example shown that I^{2}C A is in default mode. Write (B8h), Read (B9h)

Power-up, Reset, and Initialization

No specific power-up sequence is required, but all power supplies should be active and stable within 500 ms of each other. Reset may be low during power-up, but must remain low for at least 1 μs after the power supplies become stable. Alternately reset may be asserted any time with minimum 5 ms delay after power-up and must remain asserted for at least 1 μs. Reset timing is shown in Figure 7. It is also recommended that any I^{2}C operation starts 1 μs after reset ended. Table 4 describes the status of the TVP7000 terminals during and immediately after reset.

Table 4. Reset Sequence

SIGNAL NAME	DURING RESET	RESET COMPLETED
ROUT[9:0], BOUT[9:0], BOUT[9:0]	High impedence	Output
HSOUT, VSOUT, SOGOUT	High impedence	Output
DATACLK	High impedence	Output
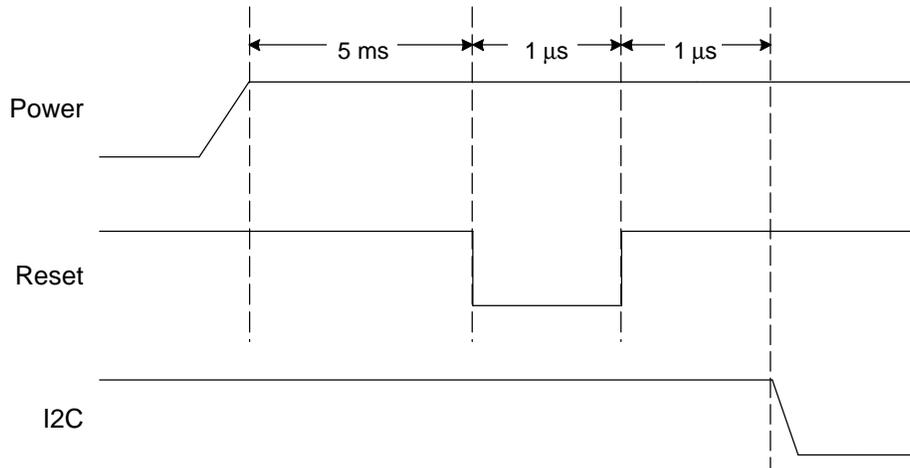

Figure 7. Reset Timing

Control Registers

The TVP7000 is initialized and controlled by a set of internal registers that define the operating parameters of the entire device. Communication between the external controller and the TVP7000 is through a standard I^{2}C host port interface, as described earlier.

Table 5 shows the summary of these registers. Detailed programming information for each register is described in the following sections.

Table 5. Control Registers Summary[(1)(2)]

Register Name	I^{2}C Subaddress	Default	R/W
Chip Revision	00h		R
PLL Divide MSB	01h	69h	R/W
PLL Divide LSB	02h	D0h	R/W
PLL Control	03h	48h	R/W
Phase Select	04h	80h	R/W
Clamp Start	05h	80h	R/W
Clamp Width	06h	80h	R/W
HSYNC Output Width	07h	20h	R/W
Blue Fine Gain	08h	80h	R/W
Green Fine Gain	09h	80h	R/W
Red Fine Gain	0Ah	80h	R/W
Blue Fine Offset	0Bh	80h	R/W
Green Fine Offset	0Ch	80h	R/W
Red Fine Offset	0Dh	80h	R/W
Sync Control 1	0Eh	40h	R/W
PLL and Clamp Control	0Fh	4Eh	R/W

(1) Register addresses not shown in the register map summary are reserved and must not be written to.
(2) Writing to or reading from any value labeled "Reserved" register may cause erroneous operation of the TVP7000. For registers with reserved bits, a 0b must be written to reserved bit locations unless otherwise stated.

Table 5. Control Registers Summary (continued)

Register Name	I²C Subaddress	Default	R/W
Sync On Green Threshold	10h	B8h	R/W
Sync Separator Threshold	11h	20h	R/W

Register Definitions

Chip Revision

Subaddress   00h   Read Only

7	6	5	4	3	2	1	0
Chip revision [7:0]							

Chip revision [7:0]: Chip revision number

TVP7000

TEXAS INSTRUMENTS
www.ti.com

PLL Divide

Subaddress   01h–02h   Default (69D0h)

7	6	5	4	3	2	1	0
PLL divide MSB [11:4]							
PLL divide LSB [3:0]				Reserved			

PLL divide [11:0]: PLL divide number sets the number of pixels per line. Controls the PLL feedback divider. MSB [11:4] bits should be loaded first whenever a change is required

PLL Control

Subaddress   03h   Default (48h)

7	6	5	4	3	2	1	0
VCO[1:0]		Charge Pump Current [3:1]			Reserved	Reserved	Reserved

VCO [1:0]: Selects VCO frequency range

        00 = Ultra low

        01 = Low (default)

        10 = Medium

        11 = High

Charge Pump Current [3:0]: Selects charge current of PLL LPF

        000 = Small (default)

        111 = Large

Phase Select

Subaddress   04h   Default (80h)

7	6	5	4	3	2	1	0
Phase Select [4:0]					Reserved		DIV2

Phase Select [4:0]: ADC Sampling clock phase select. (1 LSB = 360/32 = 11.25°)

DATACLK Divide-by-2

      0 = DATACLK/1

      1 = DATACLK/2

Clamp Start

Subaddress   05h   Default (80h)

7	6	5	4	3	2	1	0
Clamp Start [7:0]							

Clamp Start [7:0]: Positions the clamp signal an integer number of clock periods after the HSYNC signal. If external clamping is selected this value has no meaning

Clamp Width

Subaddress   06h   Default (80h)

7	6	5	4	3	2	1	0
Clamp Width [7:0]							

Clamp Width [7:0]: Sets the width in pixels for clamp. See register Clamp Start.

Table 6. Recommended Fine Clamp Settings

VIDEO STANDARD	CLAMP START	CLAMP WIDTH
HDTV (tri-level)	50 (32h)	32 (20h)
SDTV (bi-level)	6 (06h)	16 (10h)
PC Graphics	6 (06h)	16 (10h)

HSYNC Output Width

Subaddress   07h   Default (20h)

7	6	5	4	3	2	1	0
HSOUT Width [7:0]							

HSOUT Width [7:0]: Sets the width in pixels for HSYNC output.

Blue Fine Gain

Subaddress   08h   Default (80h)

7	6	5	4	3	2	1	0
Blue Gain [7:0]							

Blue Gain [7:0]: PGA digital gain (contrast) for Blue channel applied after the ADC. Gain = 1 + Blue Gain[7:0]/256
80h = Recommended setting for 700 mVp-p input and default Coarse Gain (default).

Green Fine Gain

Subaddress   09h   Default (80h)

7	6	5	4	3	2	1	0
Green Gain [7:0]							

Green Gain [7:0]: PGA digital gain (contrast) for Green channel applied after the ADC. Gain = 1 + Green Gain[7:0]/256
80h = Recommended setting for 700 mVp-p input and default Coarse Gain (default).

Red Fine Gain

Subaddress   0Ah   Default (80h)

7	6	5	4	3	2	1	0

Red Gain [7:0]

Red Gain [7:0]: Sets PGA digital gain (contrast) for Red channel applied after the ADC. Gain = 1 + Red Gain[7:0]/256
80h = Recommended setting for 700 mVp-p input and default Coarse Gain (default).

Blue Fine Offset

Subaddress   0Bh   Default (80h)

7	6	5	4	3	2	1	0

Blue Offset [9:2]

Blue Offset [9:2]: DC digital offset (brightness) for Blue channel applied after the ADC.
The default setting of 80h will place the bottom-level (YRGB) clamped output blank levels at 0 and mid-level clamped (PbPr) output blank levels at 512.

Blue Offset	Description
11111111	maximum
100000001	1 LSB
10000000	0 (default)
01111111	−1 LSB
00000000	minimum

Green Fine Offset

Subaddress   0Ch   Default (80h)

7	6	5	4	3	2	1	0
Green Offset [9:2]							

Green Offset [9:2]: DC digital offset (brightness) for Green channel applied after the ADC. See Red Fine Offset register at I^{2}C address 0x0B

Red Fine Offset

Subaddress   0Dh   Default (80h)

7	6	5	4	3	2	1	0
Red Offset [9:2]							

Red Offset [9:2]: DC digital offset (brightness) for Red channel applied after the ADC. See Blue Fine Offset register at I^{2}C address 0x0B.

Sync Control 1

Subaddress   0Eh   Default (40h)

7	6	5	4	3	2	1	0
HSPO	HSIP	HSOP	AHSO	AHSS	VSOI	AVSO	AVS

HSPO: HSYNC Polarity Override

      0 =   Polarity determined by chip (default)

      1 =   Polarity set by Bit 6 in register 0Eh

HSIP: HSYNC Input Polarity

      0 =   Indicates input HSYNC polarity active low

      1 =   Indicates input HSYNC polarity active high (default)

HSOP: HSYNC Output Polarity

      0 =   Active low (default)

      1 =   Active high

AHSO: Active HSYNC Override

      0 =   The active interface is selected via Bit 6 in register 14h, selected by chip (default)

      1 =   The user can select HSYNC to be used via Bit 3

AHSS: Active HSYNC Select. The indicated HSYNC will be used only if Bit 4 is set to 1 or both syncs are active (Bits 1,7 =1 in 14h)

      0 =   Select HSYNC as the active sync (default)

      1 =   Select Sync-on-green as the active sync

VSOI: VSYNC Output Invert (relative to VSYNC IN polarity)

      0 =   No invert (default)

      1 =   Invert

AVSO: Active VSYNC Override

      0 =   The active interface is selected via Bit3 in register 14h, selected by chip (default)

      1 =   The user can select the VSYNC to be used via Bit 0

AVS: Active VSYNC select, This bit is effective when AVSO Bit 1 is set to 1.

      0 =   Raw VSYNC (default)

      1 =   Sync separated VSYNC

TVP7000

PLL and Clamp Control

Subaddress   0Fh   Default (4Eh)

7	6	5	4	3	2	1	0
CF	CP	Coast Sel	CPO	CPC	Reserved	FCPD	Free run

Clamp Function:

      0 = Internal Clamp(default)

      1 = External Clamp

Clamp Polarity:

      0 = Active high

      1 = Active low (default)

Coast Select:

      0 = External coast (default)

      1 = Internal Coast

Coast Polarity Override:

      0 = Polarity determined by chip (default)

      1 = Polarity set be Bit 3 in register 0Fh

Coast Polarity Change:

      0 = Active low

      1 = Active high (default)

Full Chip Power-Down:

      0 = Power-down mode

      1 = Normal operation (default)

Free run: Also ADC test mode, ADC uses external clock

      0 = PLL normal operation (default)

      1 = Enabled

Sync On_Green Threshold

Subaddress   10h   Default (B8h)

7	6	5	4	3	2	1	0
SOG Threshold [4:0]					Blue CS	Green CS	Red CS

SOG Threshold [4:0]: Sets the voltage level of the SOG slicer comparator. The minimum setting is 0 mV and the maximum is 350 mV. The step is 11 mV. (default 17h, 10h recommended)

Blue Clamp Select: When free running mode this bit is no effect

      0 = Bottom level clamp (default)

      1 = Mid level clamp

Green Clamp Select: When free running mode this bit is no effect

      0 = Bottom level clamp (default)

      1 = Mid level clamp

Red Clamp Select: When free running mode this bit is no effect.

      0 = Bottom level clamp (default)

      1 = Mid level clamp

Sync Separator Threshold

Subaddress   11h   Default (20h)

7	6	5	4	3	2	1	0
Sync Separator Threshold [7:0]							

Sync Separator Threshold [7:0]: Sets how many internal 5 MHz clock periods the sync separator will count to before toggling high or low. The selection of this register affects the VSYNC out position relative to HSYNC out.

Pre-Coast

Subaddress   12h   Default (00h)

7	6	5	4	3	2	1	0
Pre-Coast [7:0]							

Pre-Coast [7:0]: Sets the number of HSYNC periods that coast becomes active prior to VSYNC.

Post-Coast

Subaddress   13h   Default (00h)

7	6	5	4	3	2	1	0
Post-Coast [7:0]							

Post-Coast [7:0]: Sets the number of HSYNC periods that coast stays active following VSYNC.

Table 7. Recommended Pre and Post-Coast Settings

STANDARD	PRE_COAST	POST-COAST
480i/p with Macrovision	3	0Ch
576i/p with Macrovision	3	0Ch
1080i	3	0
1080p	0	0
720p	0	0

Sync Detect Status

Subaddress   14h   Read Only

7	6	5	4	3	2	1	0
HSD	AHS	IHSPD	VSD	AVS	VSPD	SOGD	ICPD

HSYNC Detect:

      0 = No HSYNC detected

      1 = HSYNC detected

Active HSYNC:

      0 = HSYNC input pin

      1 = HSYNC from SOG

Input HSYNC Polarity Detect:

      0 = Active low

      1 = Active high

VSYNC Detect:

      0 = No VSYNC detected

      1 = VSYNC detected

AVS:

      0 = VSYNC input pin

      1 = VSYNC from Sync separator

VSYNC Polarity Detect:

      0 = Active low

      1 = Active high

SOG Detect:

      0 = No SOG detected

      1 = SOG is present on the SOG interface

Input Coast Polarity Detect:

      0 = Active low

      1 = Active high

Output Formater

Subaddress   15h   Default (00h)

7	6	5	4	3	2	1	0
Reserved				Clamp REF	CbCr order	422/444	Reserved

Clamp REF:

      0 = Clamp pulse placement respect to the trailing edge of HSYNC (default)

      1 = Clamp pulse placement respect to the leading edge of HSYNC

CbCr order: This bit is effective when Bit 1 is set to 1.

      0 = CrCb (default)

      1 = CbCr

422/444:

      0 = Output is in 4:4:4 format (default)

      1 = Output is in 4:2:2 format

Test Register

Subaddress   16h   Default (00h)

7	6	5	4	3	2	1	0
Pixel tolerance [2:0]			Reserved	Test ouptut		PLL PD	STRTB

Pixel tolerance:

       000 =   No tolerance (default)

       001 =   1 pixel tolerance (recommended setting for best SOG performance)

       111 =   7 pixel tolerance (maximum)

Test output: Controls TEST 1 pin output

       00 =   5 MHz clock (default)

       01 =   Coast output

       10 =   Clamp

       11 =   High impedance

PLL PD: PLL power-down

       0 =   Normal operation (default)

       1 =   PLL powered down

STRTB: PLL start-up circuit enable

       0 =   Disabled (default)

       1 =   Enabled

Input Mux Select 1

Subaddress   19h   Default (00h)

7	6	5	4	3	2	1	0
SOG Select [1:0]		Red Select [1:0]		Green Select [1:0]		Blue Select [1:0]	

SOG Select [1:0]:

       00 =   CH1 selected (default)

       01 =   CH2 selected

       10 =   CH3 selected

       11 =   Reserved

Red Select [1:0]:

       00 =   CH1 selected (default)

       01 =   CH2 selected

       10 =   CH3 selected

       11 =   Reserved

Green Select [1:0]:

       00 =   CH1 selected (default)

       01 =   CH2 selected

       10 =   CH3 selected

       11 =   CH4 selected

Blue Select [1:0]:

       00 =   CH1 selected (default)

       01 =   CH2 selected

       10 =   CH3 selected

       11 =   Reserved

Input Mux Select 2

Subaddress   1Ah   Default (00h)

7	6	5	4	3	2	1	0
1	Reserved				VSYNC Select	Reserved	HSYNC Select

Bit 7: It must be written to 1.

VSYNC Select:

    0 = VSYNC_A selected (default)

    1 = VSYNC_B selected

HSYNC Select [1:0]:

    0 = HSYNC_A selected (default)

    1 = HSYNC_B selected

Blue and Green Coarse Gain

Subaddress   1Bh   Default (55h)

7	6	5	4	3	2	1	0
Green Gain [3:0]				Blue Gain [3:0]			

Green Coarse Gain [3:0]: Coarse analog gain for Green channel applied before the ADC.

Gain [3:0]   Description

    0000 = 0.5

    0001 = 0.6

    0010 = 0.7

    0011 = 0.8

    0100 = 0.9

    0101 = 1.0

    0110 = 1.1

    0111 = 1.2

    1000 = 1.3   Maximum recommended gain for 700mVp-p input.

    1001 = 1.4

    1010 = 1.5

    1011 = 1.6

    1100 = 1.7

    1101 = 1.8

    1110 = 1.9

    1111 = 2.0

Blue Coarse Gain [3:0]: Coarse gain for Blue channel

Red Coarse Gain

Subaddress   1Ch   Default (05h)

7	6	5	4	3	2	1	0
Reserved				Red Gain [3:0]			

Red Coarse Gain [3:0]: Coarse analog gain for Red channel applied before the ADC.

Fine Offset LSB

Subaddress   1Dh   Default (00h)

7	6	5	4	3	2	1	0
Reserved		Red Offset [1:0]		Green Offset [1:0]		Blue Offset [1:0]	

Red Offset [1:0] : Offset LSB for red channel. This is LSB of register 0x0D

Green Offset [1:0] : Offset LSB for green channel. This is LSB of register 0x0C

Blue Offset [1:0] : Offset LSB for blue channel. This is LSB of register 0x0B

Blue Coarse Offset

Subaddress   1Eh   Default (20h)

7	6	5	4	3	2	1	0
Reserved		Blue offset [5:0]					

Blue Coarse offset [5:0]: Coarse analog offset for blue channel applied before the ADC.

　　　1Fh = +31 LSB (Recommended for optimum ALC performance)

　　　00h = 0 LSB

　　　20h = -1 LSB (default)

　　　3Fh = -32 LSB

Green Coarse Offset

Subaddress   1Fh   Default (20h)

7	6	5	4	3	2	1	0
Reserved		Coarse Green offset [5:0]					

Green Coarse offset [5:0]: Coarse analog offset for green channel applied before the ADC.

　　　1Fh = +31 LSB (Recommended for optimum ALC performance)

Red Coarse Offset

Subaddress   20h   Default (20h)

7	6	5	4	3	2	1	0
Reserved		Coarse Red offset [5:0]					

Red Coarse offset [5:0]: Coarse analog offset for blue channel applied before the ADC.

　　　1Fh = +31 LSB (Recommended for optimum ALC performance)

HSOUT Output Start

Subaddress   21h   Default (09h)

7	6	5	4	3	2	1	0
HSOUT Start [7:0]							

HSOUT Start [7:0]: HSYNC output Start pixel number.

MISC Control

Subaddress   22h   Default (00h)

7	6	5	4	3	2	1	0
Reserved				MAC_EN	Reserved	VS_ALIGN	Reserved

MAC_EN:

> 0 = Macrovision compatibility disabled (default)

> 1 = Macrovision compatibility enabled

VS_ALIGN

> 0 = VSOUT alignment relative to HSOUT varies with SyncSep Threshold

> 1 = VSOUT alignment not affected by SyncSep Threshold

Automatic Level Control Enable

Subaddress   26h   Default (00h)

7	6	5	4	3	2	1	0
ALC enable	Reserved						

ALC enable: Automatic level control enable

> 0 = Disabled (default)

> 1 = Enabled

Automatic Level Control Filter

Subaddress   **28h**   Default (00h)

7	6	5	4	3	2	1	0
Reserved	NSV[3:0]				NSH [2:0]		

The horizonal ALC coefficient (NSH) specifies the number of the horizonal samples (N) used to calculate the average blank level per horizonal line. Offset error correction is applied immediately based on the vertical (NSV) coefficient.
The vertical coefficient (NSV) specifies the amount of offset error correction (derived from NSH) that is applied to each line update.

NSV [3:0]: ALC vertical filter coefficient

NSV [3:0]	Description	
0000 =	1 (default)	Maximum error correction applied per line update
0001 =	1/2	
0010 =	1/4	
0011 =	1/8	
0100 =	1/16	
0101 =	1/32	
0110 =	1/64	
0111 =	1/128	
1000 =	1/256	
1001 =	1/512	
1010 =	1/1024	
1011 =	1/2048	
1100 =	1/4096	
1101 =	1/8192	
1110 =	1/16384	
1111 =	1/32768	Minimum error correction applied per line update

NSH [2:0]: ALC horizontal sample filter coefficient

NSH [2:0]	Description	
000 =	1 (default)	Minimum number of pixels used in horizontal filter
001 =	1/2	
010 =	1/4	
011 =	1/8	
100 =	1/16	
101 =	1/32	
110 =	1/64	
111 =	1/128	Maximum number of pixels used in horizonal filter

Fine Clamp Control

Subaddress   2Ah   Default (00h)

7	6	5	4	3	2	1	0
Reserved			Fine swsel[1:0]		Fine B	Fine G	Fine R

Fine swsel: Fine clamp time constant adjustment

        00 = Highest (default)

        01 =

        10 =

        11 = Lowest

Fine B:

        0 = Blue channel fine clamp is off (default)

        1 = Blue channel fine clamp is on

Fine G:

        0 = Green channel fine clamp is off (default)

        1 = Green channel fine clamp is on

Fine R:

        0 = Red channel fine clamp is off (default)

        1 = Red channel fine clamp is on

Power Control

Subaddress   2Bh   (Default 00h)

7	6	5	4	3	2	1	0
	SOG	SLICER	REF	CURRENT	PW ADC B	PW ADC G	PW ADC R

SOG:

        0 = Normal operation (default)

        1 = SOG power-down

Slicer:

        0 = Normal operation (default)

        1 = Slicer power-down

Reference:

        0 = Normal operation (default)

        1 = Reference block power-down

Current control:

        0 = Normal operation (default)

        1 = Current control block power-down

PW ADC B: Power-down ADC blue channel

        0 = PW ADC R: Power-down ADC red channel

        1 = ADC channel 1 power-down

PW ADC G: Power-down ADC green channel

        0 = PW ADC R: Power-down ADC red channel

        1 = ADC channel 2 power-down

PW ADC R: Power-down ADC red channel

        0 = PW ADC R: Power-down ADC red channel

        1 = ADC channel 3 power-down

ADC Setup

Subaddress   2Ch   (Default 00h)

7	6	5	4	3	2	1	0
0	1	1	0	0	0	0	0

50h = Recommended setting

Coarse Clamp Control

Subaddress   2Dh   Default (00h)

7	6	5	4	3	2	1	0
CCCLP_cur_CH1		Reserved			Coarse B	Coarse G	Coarse R

Coarse clamp charge current switch selection:

        00 = Highest (default)

        01 =

        10 =

        11 = Lowest

Course B:

        0 = Coarse clamp off at BLUE channel (default)

        1 = Coarse clamp on at BLUE channel

Coarse G :

        0 = Coarse clamp off at GREEN channel (default)

        1 = Coarse clamp on at GREEN channel

Coarse R :

        0 = Coarse clamp off at RED channel (default)

        1 = Coarse clamp on at RED channel

SOG Clamp

Subaddress   2Eh   (Default 00h)

7	6	5	4	3	2	1	0
SOG_CE	Reserved						

SOG_CE:

        0 = SOG Clamp disabled (default)

        1 = SOG Clamp enabled. Set to 1 for SOG operation.

ALC Placement

Subaddress   31h   (Default 00h)

7	6	5	4	3	2	1	0
ALC placement [7:0]							

ALC placement [7:0]:

        0 = Default

      18h = PC graphics and SDTV with
            bi-level syncs

      5Ah = HDTV with tri-level syncs

Positions the ALC signal an integer number of clock periods after the HSYNC signal. ALC must be applied after the clamp end.

PACKAGING INFORMATION

Orderable Device	Status [1]	Package Type	Package Drawing	Pins	Package Qty	Eco Plan [2]	Lead/Ball Finish	MSL Peak Temp [3]
TVP7000PZP	ACTIVE	HTQFP	PZP	100	90	Green (RoHS & no Sb/Br)	CU NIPDAU	Level-3-260C-168 HR
TVP7000PZPR	ACTIVE	HTQFP	PZP	100	1000	TBD	CU NIPDAU	Level-4-220C-72 HR

[1] The marketing status values are defined as follows:
ACTIVE: Product device recommended for new designs.
LIFEBUY: TI has announced that the device will be discontinued, and a lifetime-buy period is in effect.
NRND: Not recommended for new designs. Device is in production to support existing customers, but TI does not recommend using this part in a new design.
PREVIEW: Device has been announced but is not in production. Samples may or may not be available.
OBSOLETE: TI has discontinued the production of the device.

[2] Eco Plan - The planned eco-friendly classification: Pb-Free (RoHS) or Green (RoHS & no Sb/Br) - please check http://www.ti.com/productcontent for the latest availability information and additional product content details.
TBD: The Pb-Free/Green conversion plan has not been defined.
Pb-Free (RoHS): TI's terms "Lead-Free" or "Pb-Free" mean semiconductor products that are compatible with the current RoHS requirements for all 6 substances, including the requirement that lead not exceed 0.1% by weight in homogeneous materials. Where designed to be soldered at high temperatures, TI Pb-Free products are suitable for use in specified lead-free processes.
Green (RoHS & no Sb/Br): TI defines "Green" to mean Pb-Free (RoHS compatible), and free of Bromine (Br) and Antimony (Sb) based flame retardants (Br or Sb do not exceed 0.1% by weight in homogeneous material)

[3] MSL, Peak Temp. -- The Moisture Sensitivity Level rating according to the JEDEC industry standard classifications, and peak solder temperature.

Important Information and Disclaimer: The information provided on this page represents TI's knowledge and belief as of the date that it is provided. TI bases its knowledge and belief on information provided by third parties, and makes no representation or warranty as to the accuracy of such information. Efforts are underway to better integrate information from third parties. TI has taken and continues to take reasonable steps to provide representative and accurate information but may not have conducted destructive testing or chemical analysis on incoming materials and chemicals. TI and TI suppliers consider certain information to be proprietary, and thus CAS numbers and other limited information may not be available for release.

In no event shall TI's liability arising out of such information exceed the total purchase price of the TI part(s) at issue in this document sold by TI to Customer on an annual basis.

PZP (S−PQFP−G100)   PowerPAD™ PLASTIC QUAD FLATPACK

4146929/B 08/03
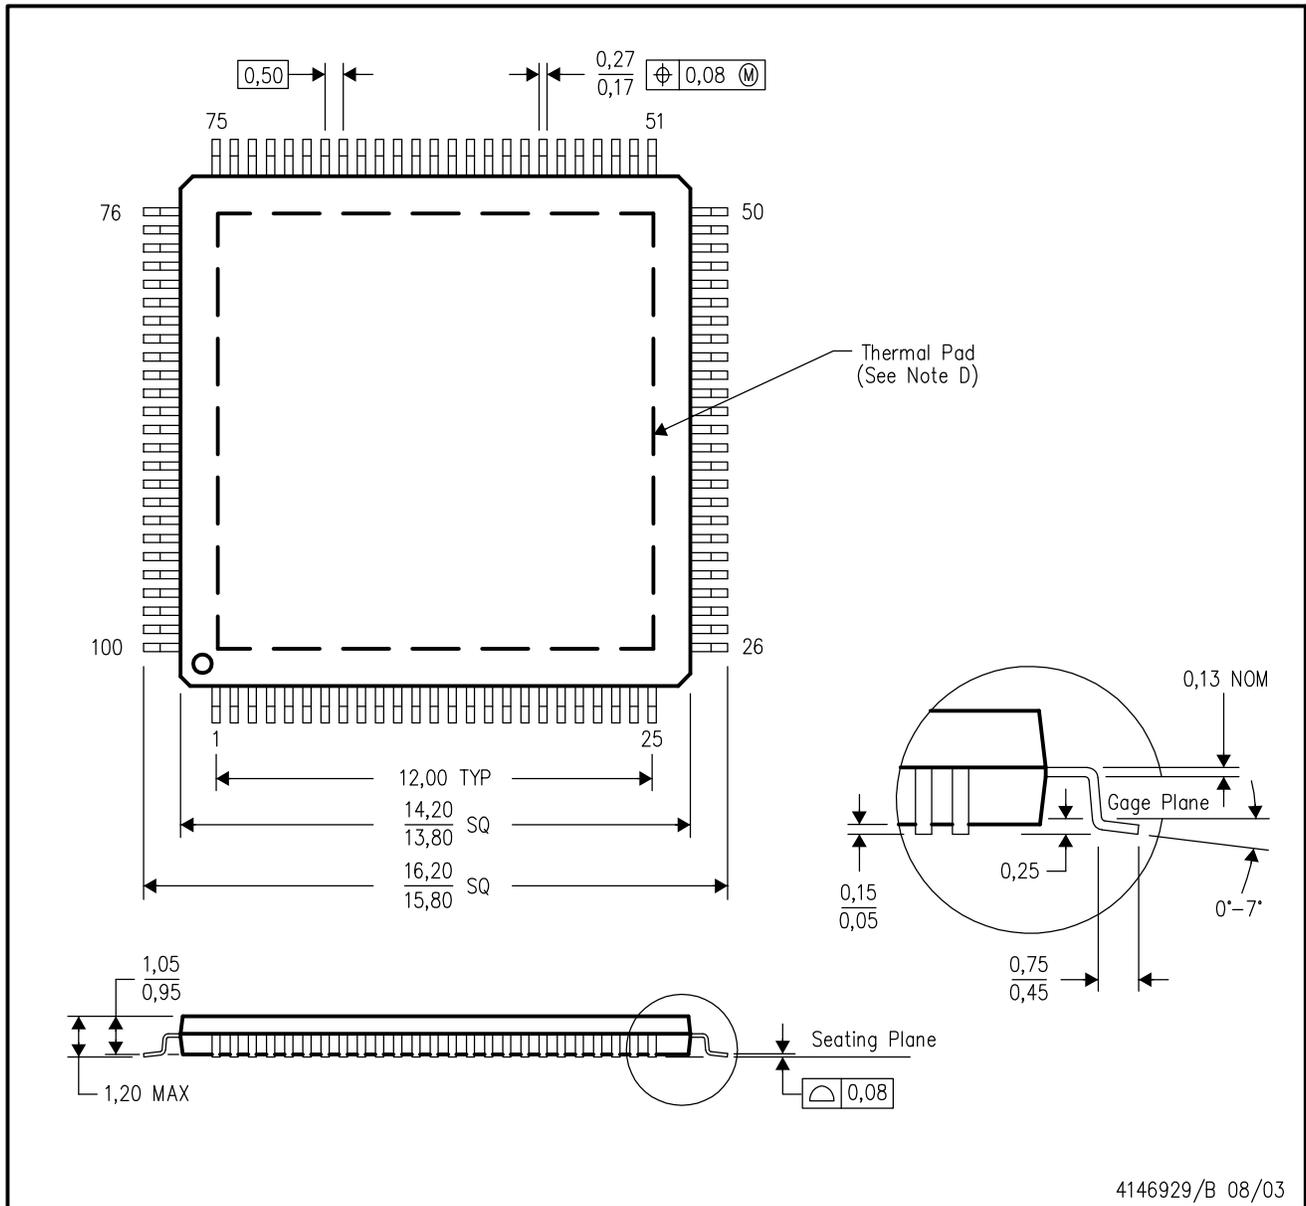

NOTES: A.   All linear dimensions are in millimeters.

IMPORTANT NOTICE

Texas Instruments Incorporated and its subsidiaries (TI) reserve the right to make corrections, modifications, enhancements, improvements, and other changes to its products and services at any time and to discontinue any product or service without notice. Customers should obtain the latest relevant information before placing orders and should verify that such information is current and complete. All products are sold subject to TI's terms and conditions of sale supplied at the time of order acknowledgment.

TI warrants performance of its hardware products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are used to the extent TI deems necessary to support this warranty. Except where mandated by government requirements, testing of all parameters of each product is not necessarily performed.

TI assumes no liability for applications assistance or customer product design. Customers are responsible for their products and applications using TI components. To minimize the risks associated with customer products and applications, customers should provide adequate design and operating safeguards.

TI does not warrant or represent that any license, either express or implied, is granted under any TI patent right, copyright, mask work right, or other TI intellectual property right relating to any combination, machine, or process in which TI products or services are used. Information published by TI regarding third-party products or services does not constitute a license from TI to use such products or services or a warranty or endorsement thereof. Use of such information may require a license from a third party under the patents or other intellectual property of the third party, or a license from TI under the patents or other intellectual property of TI.

Reproduction of information in TI data books or data sheets is permissible only if reproduction is without alteration and is accompanied by all associated warranties, conditions, limitations, and notices. Reproduction of this information with alteration is an unfair and deceptive business practice. TI is not responsible or liable for such altered documentation.

Resale of TI products or services with statements different from or beyond the parameters stated by TI for that product or service voids all express and any implied warranties for the associated TI product or service and is an unfair and deceptive business practice. TI is not responsible or liable for any such statements.
