

- Li-Ion Battery Charging Control
- Over-Voltage Shutdown
- Seven Low-Dropout Low-Noise Linear Voltage Regulators (LDO)
- Voltage Detectors (With Power-Off Delay)
- Four-Channel Analog Multiplexer
- Three General-Purpose Operational Amplifiers
- Ringer Driver
- Power Supply Switch for Accessories
- Low Quiescent Current
- 48-pin TQFP

PFB PACKAGE  
(TOP VIEW)

### description

The TWL2203 incorporates a complete power-management system for a cellular telephone that uses lithium-ion cells. The device includes circuitry to control the gate voltage of two P-channel MOSFETs. The MOSFETs perform constant-voltage/constant-current charging (CVCC). The TWL2203 has seven low-drop linear voltage regulators (LDO) to regulate the battery power supply to the different sections of the phone, a battery voltage monitor, a ringer driver, an analog multiplexer, and three general-purpose operational amplifiers for signal conditioning.

The TWL2203 is packaged in TI's 48-pin thin-quad flat package (PFB).

Please be aware that an important notice concerning availability, standard warranty, and use in critical applications of Texas Instruments semiconductor products and disclaimers thereto appears at the end of this data sheet.

MicroStar is a trademark of Texas Instruments Incorporated.

PRODUCTION DATA information is current as of publication date. Products conform to specifications per the terms of Texas Instruments standard warranty. Production processing does not necessarily include testing of all parameters.

**Terminal Functions**

TERMINAL		I/O	DESCRIPTION
NAME	NO. QFB		
CH	39	I	CMOS signal input set to logic high to enable battery-charging function
DET_DELAY	33	I/O	Delay programming pin for VDET2
DET1	21	O	Voltage detector CMOS output
DET2	19	O	Voltage detector output with 40-k $\Omega$ pull-up resistor
EN1	23	I	Set to logic high to enable LDO regulators 1–4 and power supply switch
EN2	24	I	Set to logic high to enable LDO regulator 5
EN3	25	I	Set to logic high to enable LDO regulator 6
EN4	22	I	Set to logic high to enable LDO regulator 7
ENOP_MUX	42	I	Set to logic high to enable the op amps and the analog multiplexer
GND	18		Ground for most sections of the device
GNDRING	37		Ringer ground
IADJ	47	I/O	Terminal for gain control of battery-charging current monitor
ICH–	43	I	Current-sense input/trickle charge, input/power supply to LDO regulator 7, and reference.
ICH+	45	I	Current-sense input
MUX0	4	I	Analog multiplexer channel selector bit-input (logic high is true)
MUX1	5	I	Analog multiplexer channel selector bit-input (logic high is true)
MUXIN0	3	I	Analog multiplexer input 0
MUXIN1	6	I	Analog multiplexer input 1
MUXIN2	7	I	Analog multiplexer input 2
MUXIN3	8	I	Analog multiplexer input 3
MUXOUT	2	O	Analog multiplexer output
OP1I–	9	I	Op amp 1 negative input
OP1I+	10	I	Op amp 1 positive input
OP1O	15	O	Op amp 1 output
OP2I–	11	I	Op amp 2 negative input
OP2I+	12	I	Op amp 2 positive input
OP2O	16	O	Op amp 2 output
OP3I–	14	I	Op amp 3 negative input
OP3I+	13	I	Op amp 3 positive input
OP3O	17	O	Op amp 3 output
RING	35	I	Ringer drive input
RINGON	36	I	Ringer enable (logic high to enable)
TCOUT	41	O	Trickle-charge output
V <sub>B</sub>	40	I	Battery voltage input for charging control
V <sub>CC</sub>	31		Power supply to most of the device
VCH	20	I	External power supply input for voltage detection
VEXT	48	I	External voltage input
VG1	46	O	MOSFET M1 gate drive
VG2	38	O	MOSFET M2 gate drive
VOUT1	26	O	LDO REG 1 output 1
VOUT2	32	O	LDO REG 2 output 2

### detailed description

#### battery-charging control

The battery charging control block in the device is a part of the lithium-ion battery (Li-Ion) charging system of the phone. It is capable of regulating the external power source to charge the lithium-ion battery according to the battery-charging requirements. More information on battery-charging control is presented in the *application information* section.

The MOSFET driver and its feedback-control circuit are enabled/disabled by a CMOS control signal provided by the phone's microprocessor. The maximum-charging current is set by external resistors for design flexibility.

#### overvoltage shutdown

The device shuts down the charging circuit in the presence of an overvoltage condition.

#### low-dropout linear voltage regulators

The device has seven separate low-dropout linear-voltage regulators. A single enable signal controls four of the regulators. The last three regulators are controlled by their own enable signals.

#### voltage detectors (with power-off delay)

The device has two voltage detectors. The voltage detectors monitor the voltage level of the external power and  $V_{CC}$ . The external power detector (VDET1) has a CMOS output. The  $V_{CC}$  detector (VDET2) activates on the falling edge and has user-adjustable power-off delay. There is an internal pullup resistor on the output.

#### analog multiplexer

The device has a four-channel analog multiplexer with two-bit channel-selector signal input and a shutdown function. In the shutdown mode, all the input and output terminals are in the high-impedance state.

#### operational amplifiers

The device has three rail-to-rail operational amplifiers with common shutdown control.

#### power supply switch for external phone accessories

The device provides current-limited voltage supply to the external phone accessories via the external-interface connector. The power supply switch is controlled by the same enable signal (EN1) that controls the four regulators—LDO1-LDO4. The external phone accessories are resistive in nature.

#### ringer driver

The device is capable of driving a ringer. It is controlled by a CMOS signal, and uses an N-channel low-side driver.

### THERMAL INFORMATION

The implementation of integrated circuits in low-profile and fine-pitch surface-mount packages requires special attention to power dissipation. Many system-dependent issues such as thermal coupling, airflow, added heat sinks and convection surfaces, and the presence of other heat-generating components affect the power-dissipation limits of a given component.

Three basic approaches for enhancing thermal performance are listed below.

- Improving the power dissipation capability of the printed-circuit board design
- Improving the thermal coupling of the component to the printed-circuit board
- Introducing airflow into the system

Using the given  $R_{\theta JA}$  for this device, the maximum power dissipation can be calculated with the equation:

$$P_{D(MAX)} = \frac{T_{J(MAX)} - T_A}{R_{\theta JA}}$$

### APPLICATION INFORMATION

#### capacitor selection

The output bypass capacitor of each LDO regulator should be selected from the list of ceramic capacitors shown below. The VCC bypass capacitors should be selected from the list of tantalum capacitors shown below. Tantalum capacitors have good temperature stability and offer good capacitance for their size. Care should be taken when using marginal quality tantalum capacitors, as the increase of the equivalent series resistance (ESR) at low temperatures can cause instability. For a given capacitance, ceramic capacitors are usually larger and more costly than tantalums. The capacitance of ceramic capacitors varies greatly with temperature. In addition, the ESR of ceramic capacitors can be low enough to cause instability. A low-value resistor can be added in series with the ceramic capacitor to provide a minimum ESR.

#### ceramic (X7R or X5R)

CAPACITANCE	CASE SIZE	ESR (MAX)
1 $\mu\text{F}$	0805	3.8 $\text{m}\Omega$
2.2 $\mu\text{F}$	0805	4.5 $\text{m}\Omega$
3.3 $\mu\text{F}$	0805	4.1 $\text{m}\Omega$
2.2 $\mu\text{F}$	1206	3.4 $\text{m}\Omega$
4.7 $\mu\text{F}$	1206	1.9 $\text{m}\Omega$

#### tantalum (6.3 V rating)

CAPACITANCE	CASE SIZE	ESR (MAX)
4.7 $\mu\text{F}$	A(3216)	6 $\Omega$
6.8 $\mu\text{F}$	A(3216)	6 $\Omega$
10 $\mu\text{F}$	A(3216)	4 $\Omega$
10 $\mu\text{F}$	P(0805)	6 $\Omega$

APPLICATION INFORMATION

battery charging control

# TWL2203

## POWER SUPPLY MANAGEMENT IC

SLVS185 – FEBRUARY 2000

---

### APPLICATION INFORMATION

#### battery-charging control (continued)

The battery-charging control block in the device is a part of the Li-Ion battery charging system of the phone. The device controls the P-channel MOSFET to accomplish constant-voltage/constant-current charging (CVCC) within a  $\pm 1\%$  tolerance in the charging termination voltage.

The battery charging control consists of the two sections:

- CVCC charge-switch control with feedback loops for voltage and current control
- Trickle charge-current control

When the voltage-detector output (DET1) is set high, the voltage-control loop is activated to regulate the voltage of ICH- to 4.2 V. Then, when the control signal input CH is set high, either the current-control loop or the trickle-charge control block is activated, depending upon battery voltage.

When VB is below the threshold Vtc, the trickle-charge current control block directs the current to the battery via TCIN, trickle-charging current control, TCOU, R6, and the battery. The measure of the voltage across sense resistor R6 is used for feedback-control of the rate of charging current.

Once the battery voltage reaches the threshold Vtc, the CVCC charge-switch control block becomes active and controls the P-channel MOSFET M1. The feedback control ensures that the voltage ICH- does not exceed 4.2 V  $\pm 0.05$  V (4.2 V regulation), and the current draw of resistor R1 does not exceed the specified value (current-limit control). In this case, the charging current drains via R1, M2, and the battery. The maximum charging current is set by external resistors for design flexibility.

#### analog multiplexer output table

## **IMPORTANT NOTICE**

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent TI deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

**CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.**

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

TI assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. TI's publication of information regarding any third party's products or services does not constitute TI's approval, warranty or endorsement thereof.
