DESCRIPTION

The 74LVC109 is a low-voltage Si-gate CMOS device that is pin and function compatible with 74HC/HCT109.

The 74LVC109 is a dual positive-edge triggered J$\overline{K}$-type flip-flop featuring individual J, $\overline{K}$ inputs, clock (CP) inputs, set ($\overline{S}_D$) and reset ($\overline{R}_D$) inputs; also complementary Q and $\overline{Q}$ outputs.

The set and reset are asynchronous active LOW inputs and operate independently of the clock input.

The J and $\overline{K}$ inputs control the state changes of the flip-flops as described in the mode select function table. The J and $\overline{K}$ inputs must be stable one set-up time prior to the LOW-to-HIGH clock transition for predictable operation. The J$\overline{K}$ design allows operation as a D-type flip-flop by tying the J and $\overline{K}$ inputs together.

Schmitt-trigger action in the clock input makes the circuit highly tolerant to slower clock rise and fall times.
