description

The SN74TVC3306 provides three parallel NMOS pass transistors with a common unbuffered gate. The low on-state resistance of the switch allows connections to be made with minimal propagation delay.

The device can be used as a dual switch, with the gates cascaded together to a reference transistor. The low-voltage side of each pass transistor is limited to a voltage set by the reference transistor. This is done to protect components with inputs that are sensitive to high-state voltage-level overshoots.

absolute maximum ratings over operating free-air temperature range (unless otherwise noted)†

Input voltage range, V_I (see Note 1) . . . . –0.5 V to 7 V

Input/output voltage range, $V_{I/O}$ (see Note 1) . . . . –0.5 V to 7 V

Continuous channel current . . . . 128 mA

Input clamp current, I_{IK} ($V_I < 0$) . . . . –50 mA

Package thermal impedance, θ_{JA} (see Note 2): DCT package . . . . 220°C/W

DCU package . . . . 227°C/W

Storage temperature range, T_{stg} . . . . –65°C to 150°C

† Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.

NOTES: 1. The input and input/output negative-voltage ratings may be exceeded if the input and input/output clamp-current ratings are observed.
2. The package thermal impedance is calculated in accordance with JESD 51-7.

APPLICATION INFORMATION

† V_{REF} and V_{BIAS} can be applied to any one of the pass transistors. GATE must be connected externally to V_{BIAS}.

Figure 2. Typical Application Circuit

For the clamping configuration, the common GATE input must be connected to one side (An or Bn) of any one of the pass transistors, making that the V_{BIAS} connection of the reference transistor and the opposite side (Bn or An) the V_{REF} connection. When V_{BIAS} is connected through a 200-kΩ resistor to a 3-V to 5.5-V V_{CC} supply and V_{REF} is set to 0 V to V_{CC} – 0.6 V, the output of each switch has a maximum clamp voltage equal to V_{REF}. A filter capacitor on V_{BIAS} is recommended.
