Product Description

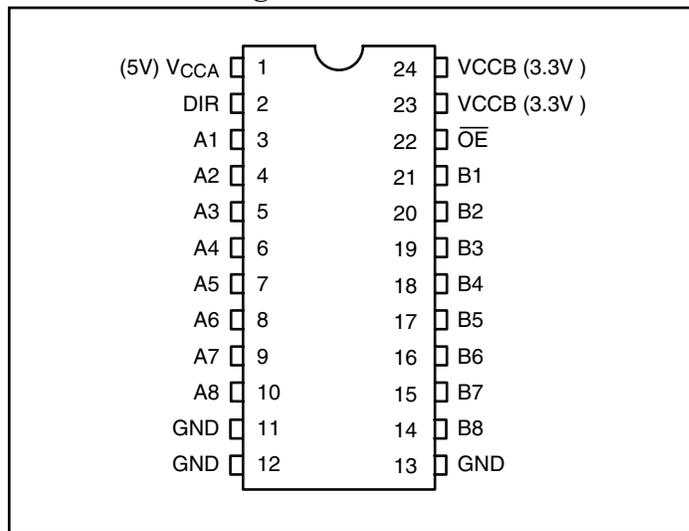

Pericom Semiconductor's PI74LVC series of logic circuits are produced using the Company's advanced submicron CMOS technology, achieving industry leading speed.

The PI74LVC4245A is a non-inverting 8-bit Bidirectional Transceiver that uses two separate power supply rails. A-port (V_{CCA}) is set to operate at 5V and B-port (V_{CCB}) is set to operate at 3.3V. This allows for translation from a 3.3V to a 5V environment and vice-versa. This transceiver is designed for asynchronous two-way communication between data buses. The direction control input pin (DIR) determines the dataflow from the A bus to the B bus or from the B bus to the A bus. The output enable (\overline{OE}) input, when HIGH, disables both A and B ports by placing them in HIGH Z condition.

Power- Up Considerations

To avoid excessive supply current, bus contention or oscillation during power-up, the following guidelines should be followed:

1. Connect ground first before any supply voltage is applied.
2. Then Power up V_{CCA} , which is the control side of the device.
3. Ramp \overline{OE} ahead of or with V_{CCA} to help prevent bus contention
4. Ramp DIR with V_{CCA} if DIR HIGH is needed (A bus to B bus). Otherwise keep DIR LOW.
