－Member of the Texas Instruments Widebus ${ }^{\text {TM }}$ Family
－EPICTM（Enhanced－Performance Implanted CMOS）Submicron Process
－Typical Volp（Output Ground Bounce） $<0.8 \mathrm{~V}$ at $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$
－Typical $\mathrm{V}_{\mathrm{OHV}}$（Output $\mathrm{V}_{\mathrm{OH}}$ Undershoot） $>2 \mathrm{~V}$ at $\mathrm{V}_{\mathrm{CC}}=3.3 \mathrm{~V}, \mathrm{~T}_{\mathrm{A}}=25^{\circ} \mathrm{C}$
－Power Off Disables Outputs，Permitting Live Insertion
－Supports Mixed－Mode Signal Operation （5－V Input and Output Voltages With $3.3-\mathrm{V} \mathrm{V}_{\mathrm{CC}}$ ）
－Bus Hold on Data Inputs Eliminates the Need for External Pullup／Pulldown Resistors
－ESD Protection Exceeds 2000 V Per MIL－STD－883，Method 3015；Exceeds 200 V Using Machine Model（ $\mathrm{C}=200 \mathrm{pF}, \mathrm{R}=0$ ）
－Latch－Up Performance Exceeds 250 mA Per JESD 17
－Packaged in Plastic Fine－Pitch Ball Grid Array Package

## description

This 32－bit transparent D－type latch is designed for $1.65-\mathrm{V}$ to $3.6-\mathrm{V} \mathrm{V}_{\mathrm{CC}}$ operation．
The SN74LVCH32373A is particularly suitable for implementing buffer registers，I／O ports，bidirectional bus drivers，and working registers．It can be used as four 8 －bit latches，two 16 －bit latches，or one 32 －bit latch．When the latch－enable（LE）input is high，the Q outputs follow the data（D）inputs．When LE is taken low，the Q outputs are latched at the levels set up at the $D$ inputs．

A buffered output－enable（ $\overline{\mathrm{OE}}$ ）input can be used to place the eight outputs in either a normal logic state（high or low logic levels）or the high－impedance state．In the high－impedance state，the outputs neither load nor drive the bus lines significantly．The high－impedance state and increased drive provide the capability to drive bus lines without interface or pullup components．
$\overline{\mathrm{OE}}$ does not affect internal operations of the latch．Old data can be retained or new data can be entered while the outputs are in the high－impedance state．

Inputs can be driven from either 3．3－V or 5－V devices．This feature allows the use of these devices as translators in a mixed $3.3-\mathrm{V} / 5-\mathrm{V}$ system environment．

To ensure the high－impedance state during power up or power down，$\overline{\mathrm{OE}}$ should be tied to $\mathrm{V}_{\mathrm{C}}$ through a pullup resistor；the minimum value of the resistor is determined by the current－sinking capability of the driver．

Active bus－hold circuitry is provided to hold unused or floating data inputs at a valid logic level．
The SN74LVCH32373A is characterized for operation from $-40^{\circ} \mathrm{C}$ to $85^{\circ} \mathrm{C}$ ．

```
\(\dagger\) Stresses beyond those listed under "absolute maximum ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
NOTES: 1. The input negative-voltage and output voltage ratings may be exceeded if the input and output current ratings are observed.
2. The value of \(\mathrm{V}_{\mathrm{CC}}\) is provided in the recommended operating conditions table.
3. The package thermal impedance is calculated in accordance with JESD 51.
```

## IMPORTANT NOTICE

Texas Instruments and its subsidiaries (TI) reserve the right to make changes to their products or to discontinue any product or service without notice, and advise customers to obtain the latest version of relevant information to verify, before placing orders, that information being relied on is current and complete. All products are sold subject to the terms and conditions of sale supplied at the time of order acknowledgement, including those pertaining to warranty, patent infringement, and limitation of liability.

TI warrants performance of its semiconductor products to the specifications applicable at the time of sale in accordance with TI's standard warranty. Testing and other quality control techniques are utilized to the extent Tl deems necessary to support this warranty. Specific testing of all parameters of each device is not necessarily performed, except those mandated by government requirements.

CERTAIN APPLICATIONS USING SEMICONDUCTOR PRODUCTS MAY INVOLVE POTENTIAL RISKS OF DEATH, PERSONAL INJURY, OR SEVERE PROPERTY OR ENVIRONMENTAL DAMAGE ("CRITICAL APPLICATIONS"). TI SEMICONDUCTOR PRODUCTS ARE NOT DESIGNED, AUTHORIZED, OR WARRANTED TO BE SUITABLE FOR USE IN LIFE-SUPPORT DEVICES OR SYSTEMS OR OTHER CRITICAL APPLICATIONS. INCLUSION OF TI PRODUCTS IN SUCH APPLICATIONS IS UNDERSTOOD TO BE FULLY AT THE CUSTOMER'S RISK.

In order to minimize risks associated with the customer's applications, adequate design and operating safeguards must be provided by the customer to minimize inherent or procedural hazards.

Tl assumes no liability for applications assistance or customer product design. TI does not warrant or represent that any license, either express or implied, is granted under any patent right, copyright, mask work right, or other intellectual property right of TI covering or relating to any combination, machine, or process in which such semiconductor products or services might be or are used. Tl's publication of information regarding any third party's products or services does not constitute Tl's approval, warranty or endorsement thereof.
