74VCX162838 Low Voltage 16-Bit Selectable Register/Buffer with 3.6V Tolerant Inputs and Outputs and 26Ω Series Resistors in the Outputs

General Description

The VCX162838 contains sixteen non-inverting selectable buffered or registered paths. The device can be configured to operate in a registered, or flow through buffer mode by utilizing the register enable (REGE) and Clock (CP) signals. The device operates in a 16-bit word wide mode. All outputs can be placed into 3-State through the use of the OE pin. These devices are ideally suited for buffered or registered 168 pin and 200 pin SDRAM DIMM memory modules.

The 74VCX162838 is designed for low voltage (1.65V to 3.6V) V_{CC} applications with I/O compatibility up to 3.6V. The VCX162838 is also designed with 26Ω series resistors in the outputs. This design reduces line noise in applications such as memory address drivers, clock drivers, and bus transceivers/transmitters.

The 74VCX162838 is fabricated with an advanced CMOS technology to achieve high speed operation while maintaining low CMOS power dissipation.

Functional Description

The 74VCX162838 consists of sixteen selectable non-inverting buffers or registers with word wide controls. Mode functionality is selected through operation of the CP and REGE pin as shown by the truth table. When REGE is held at a logic "1" the device operates as a 16-bit register. Data is transferred from I_n to O_n on the rising edge of the CP pin. When the REGE pin is held at a logic "0" the device operates in a flow through mode and data propagates directly from the I to the O outputs. All outputs can be 3-stated by holding the \overline{OE} pin at a logic "1".
