SEMICONDUCTOR TECHNICAL DATA

÷4 Divider

The MC100LVEL33 is an integrated ÷4 divider. The differential clock inputs and the V_{BB} allow a differential, single-ended or AC coupled interface to the device. If used, the V_{BB} output should be bypassed to ground with a $0.01\mu\text{F}$ capacitor. Also note that the V_{BB} is designed to be used as an input bias on the EL33 only, the V_{BB} output has limited current sink and source capability. The LVEL is functionally equivalent to the EL33 and works from a low voltage supply.

The reset pin is asynchronous and is asserted on the rising edge. Upon power-up, the internal flip-flops will attain a random state; the reset allows for the synchronization of multiple LVEL33's in a system.

- 630ps Propagation Delay
- 4.0GHz Toggle Frequency
- High Bandwidth Output Transitions
- Operates from -3.3V (or 3.3V) Supply
- $75\text{k}\Omega$ Internal Input Pulldown Resistors
- $>2000\text{V}$ ESD Protection

1. Minimum input swing for which AC parameters are guaranteed.
2. Duty cycle skew is the difference between T_{PLH} and T_{P_{LL}}.
3. The CMR range is referenced to the most positive side of the differential input signal. Normal operation is obtained if the HIGH level falls within the specified range and the peak-to-peak voltage lies between V_{ppmin} and 1V. The lower end of the CMR range varies 1:1 with V_{EE}. The numbers in the spec table assume a nominal V_{EE} = -3.3V. Note for PECL operation, the V_{CMR(min)} will be fixed at 3.3V - |V_{CMR(min)}|.
