

TOSHIBA CMOS DIGITAL INTEGRATED CIRCUIT SILICON MONOLITHIC

TC74VHC175F, TC74VHC175FN, TC74VHC175FT

QUAD D-TYPE FLIP-FLOP WITH CLEAR

(Note) The JEDEC SOP (FN) is not available in Japan.

The TC74VHC175 is an advanced high speed CMOS QUAD D-TYPE FLIP FLOP fabricated with silicon gate C²MOS technology.

It achieves the high speed operation similar to equivalent Bipolar Schottky TTL while maintaining the CMOS low power dissipation.

These four flip-flops are controlled by a clock input (CK) and a clear input (CLR).

The information data applied to the D inputs (D1 thru D4) are transferred to the outputs (Q1 thru Q4 and \bar{Q} 1 thru \bar{Q} 4) on the positive-going edge of the clock pulse.

When the CLR input is held low, the Q outputs are at the low logic level and the \bar{Q} outputs are at the high logic level, regardless of other input conditions.

An input protection circuit ensures that 0 to 7V can be applied to the input pins without regard to the supply voltage. This device can be used to interface 5V to 3V systems and two supply systems such as battery back up. This circuit prevents device destruction due to mismatched supply and input voltages.

Note (2) C_{PD} is defined as the value of the internal equivalent capacitance which is calculated from the operating current consumption without load.

Average operating current can be obtained by the equation :

$$I_{CC(opr.)} = C_{PD} \cdot V_{CC} \cdot f_{IN} + I_{CC} / 4 \text{ (per bit)}$$

And the total C_{PD} when n pcs of Flip Flop operate can be gained by the following equation :

$$C_{PD} \text{ (total)} = 30 + 14 \cdot n$$
