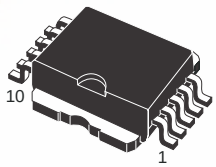
VNQ660SP

QUAD CHANNEL HIGH SIDE SOLID STATE RELAY

TYPE	$R_{DS(on)}$	I_{OUT}	V_{CC}
VNQ660SP	50mΩ (*)	6A	36 V

(*) Per each channel

- OUTPUT CURRENT PER CHANNEL: 6A
- CMOS COMPATIBLE INPUTS
- OPEN LOAD DETECTION (OFF STATE)
- UNDERVOLTAGE & OVERVOLTAGE SHUT- DOWN
- OVERVOLTAGE CLAMP
- THERMAL SHUT-DOWN
- CURRENT LIMITATION
- VERY LOW STAND-BY POWER DISSIPATION
- PROTECTION AGAINST: LOSS OF GROUND & LOSS OF V_{CC}
- REVERSE BATTERY PROTECTION (**)



PowerSO-10™

ORDER CODES		
PACKAGE	TUBE	T&R
PowerSO-10™	VNQ660SP	VNQ660SP13TR

DESCRIPTION

The VNQ660SP is a monolithic device made by using STMicroelectronics VIPower M0-3 Technology, intended for driving resistive or inductive loads with one side connected to ground. This device has four independent channels. Built-in thermal shut down and output current limitation protect the chip from over temperature and short circuit.

ABSOLUTE MAXIMUM RATING

Symbol	Parameter	Value	Unit
V_{CC}	Supply voltage (continuous)	41	V
$-V_{CC}$	Reverse supply voltage (continuous)	-0.3	V
I_{OUT}	Output current (continuous), per each channel	Internally limited	A
I_R	Reverse output current (continuous), per each channel	-15	A
I_{IN}	Input current	+/- 10	mA
I_{STAT}	Status current	+/- 10	mA
I_{GND}	Ground current at $T_C \leq 25°C$ (continuous)	-200	mA
V_{ESD}	Electrostatic Discharge (Human Body Model: R=1.5KΩ; C=100pF)		
	- INPUT	4000	V
	- STATUS	4000	V
	- OUTPUT	5000	V
	- V_{CC}	5000	V
P_{tot}	Power dissipation at $T_C=25°C$	113.6	W
T_j	Junction operating temperature	-40 to 150	°C
T_{stg}	Storage temperature	-65 to 150	°C
E_C	Non repetitive clamping energy at $T_C=25°C$	150	mJ

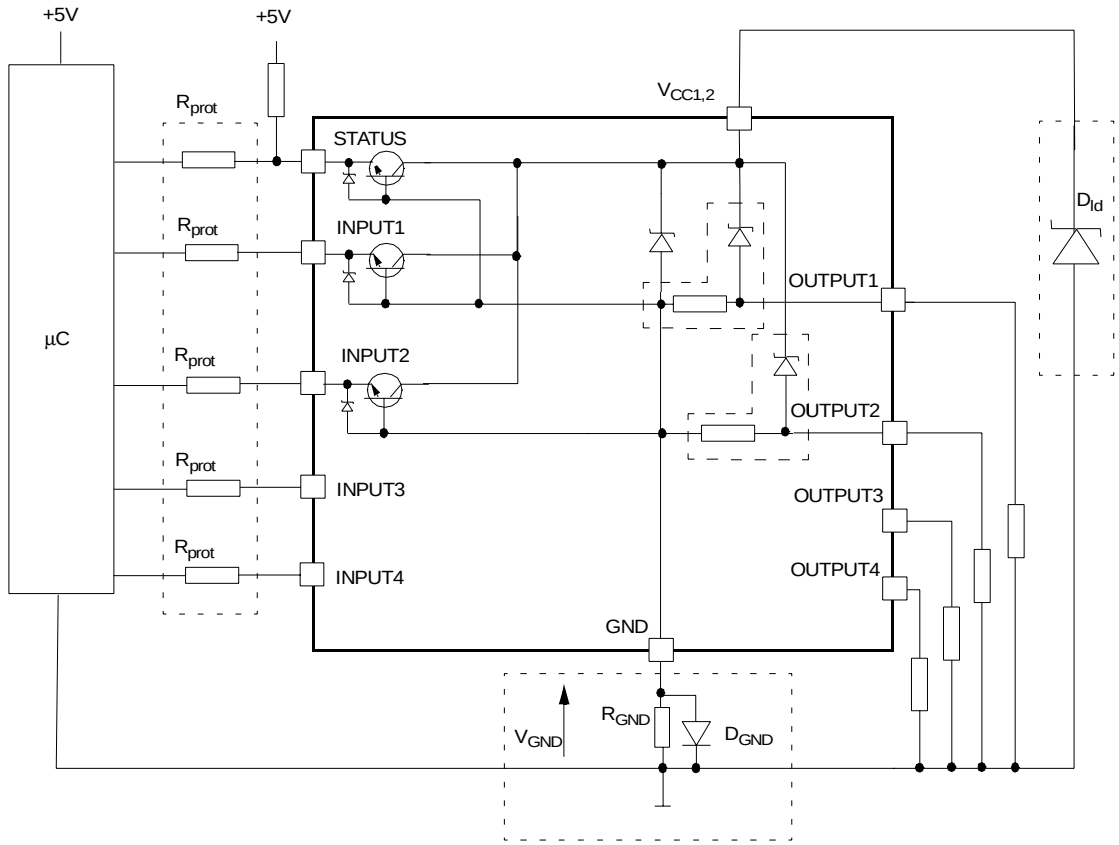
APPLICATION SCHEMATIC



Note: Channels 3 & 4 have the same internal circuit as channel 1 & 2.

GND PROTECTION NETWORK AGAINST REVERSE BATTERY

Solution 1: Resistor in the ground line (R_{GND} only). This can be used with any type of load.

The following is an indication on how to dimension the R_{GND} resistor.

1) $R_{GND} \leq 600mV / (I_{S(on)max})$.

2) $R_{GND} \geq (-V_{CC}) / (-I_{GND})$

where $-I_{GND}$ is the DC reverse ground pin current and can be found in the absolute maximum rating section of the device's datasheet.

Power Dissipation in R_{GND} (when V_{CC}<0: during reverse battery situations) is:

$P_D= (-V_{CC})^2/R_{GND}$

This resistor can be shared amongst several different HSD. Please note that the value of this resistor should be calculated with formula (1) where $I_{S(on)max}$ becomes the sum of the maximum on-state currents of the different devices.

Please note that if the microprocessor ground is not common with the device ground then the R_{GND} will produce a shift ($I_{S(on)max}$ * R_{GND}) in the input thresholds and the status output values. This shift will vary depending on how many devices are ON in the case of several high side drivers sharing the same R_{GND}.

If the calculated power dissipation leads to a large resistor or several devices have to share the same resistor then the ST suggests to utilize Solution 2 (see below).

Solution 2: A diode (D_{GND}) in the ground line.

A resistor (R_{GND}=1kΩ) should be inserted in parallel to D_{GND} if the device will be driving an inductive load.

This small signal diode can be safely shared amongst several different HSD. Also in this case, the presence of the ground network will produce a shift (≈600mV) in the input threshold and the status output values if the microprocessor ground is not common with the device

ground. This shift will not vary if more than one HSD shares the same diode/resistor network.

LOAD DUMP PROTECTION

D_{ld} is necessary (Voltage Transient Suppressor) if the load dump peak voltage exceeds V_{CC} max DC rating. The same applies if the device will be subject to transients on the V_{CC} line that are greater than the ones shown in the ISO T/R 7637/1 table.

µC I/Os PROTECTION:

If a ground protection network is used and negative transient are present on the V_{CC} line, the control pins will be pulled negative. ST suggests to insert a resistor (R_{prot}) in line to prevent the µC I/Os pins to latch-up.

The value of these resistors is a compromise between the leakage current of µC and the current required by the HSD I/Os (Input levels compatibility) with the latch-up limit of µC I/Os.

$-V_{CCpeak}/I_{latchup} \leq R_{prot} \leq (V_{OH\mu C}-V_{IH}-V_{GND}) / I_{IHmax}$

Calculation example:

For V_{CCpeak}= - 100V and $I_{latchup} \geq$ 20mA; $V_{OH\mu C} \geq$ 4.5V

5kΩ ≤ R_{prot} ≤ 65kΩ.

Recommended R_{prot} value is 10kΩ.
