Dual Supply Octal Translating Transceiver with 3-State Outputs

The 74LVX4245 is a 24–pin dual–supply, octal translating transceiver that is designed to interface between a 5V bus and a 3V bus in a mixed 3V/5V supply environment such as laptop computers using a 3.3V CPU and 5V LCD display. The A port interfaces with the 5V bus; the B port interfaces with the 3V bus.

The Transmit/Receive (T/R) input determines the direction of data flow. Transmit (active–High) enables data from the A port to the B port. Receive (active–Low) enables data from the B port to the A port. The Output Enable (OE) input, when High, disables both A and B ports by placing them in 3–State.

- Bi-directional Interface Between 5V and 3V Buses
- Control Inputs Compatible with TTL Level
- 5V Data Flow at A Port and 3V Data Flow at B Port
- Outputs Source/Sink 24mA at 5V Bus and 12mA at 3V Bus
- Guaranteed Simultaneous Switching Noise Level and Dynamic Threshold Performance
- Available in SOIC and TSSOP Packages
- Functionally Compatible with the 74 Series 245

Dual Supply Octal Translating Transceiver

The 74LVX4245 is a is a dual—supply device well capable of bidirectional signal voltage translation. This level shifting ability provides an excellent interface between low voltage CPU local bus and a standard 5V I/O bus. The device control inputs can be controlled by either the low voltage CPU and core logic or a bus arbitrator with 5V I/O levels.

The LVX4245 is ideal for mixed voltage applications such as notebook computers using a 3.3V CPU and 5V peripheral devices.

Applications:

Mixed Mode Dual Supply Interface Solutions

The LVX4245 is designed to solve 3V/5V interfaces when CMOS devices cannot tolerate I/O levels above their applied V_{CC}. If an I/O pin of a 3V device is driven by a 5V device, the P–Channel transistor in the 3V device will conduct — causing current flow from the I/O bus to the 3V power supply. The result may be destruction of the 3V device through latchup effects. A current limiting resistor may be used to prevent destruction, but it causes speed degradation and needless power dissipation.

A better solution is provided in the LVX4245. It provides two different output levels that easily handle the dual voltage interface. The A port is a dedicated 5V port; the B port is a dedicated 3V port. Figure 4 on page 6 shows how the LVX4245 may fit into a mixed 3V/5V system.

Since the LVX4245 is a '245 transceiver, the user may either use it for bidirectional or unidirectional applications. The center 20 pins are configured to match a '245 pinout.

This enables the user to easily replace this level shifter with a 3V '245 device without additional layout work or remanufacture of the circuit board (when both buses are 3V).

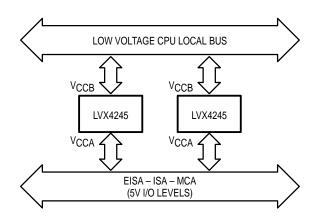

Figure 3. 3.3V/5V Interface Block Diagram

Powering Up the LVX4245

When powering up the LVX4245, please note that if the V_{CCB} pin is powered—up well in advance of the V_{CCA} pin, several milliamps of either I_{CCA} or I_{CCB} current will result. If the V_{CCA} pin is powered—up in advance of the V_{CCB} pin then only nanoamps of Icc current will result. In actuality the V_{CCB} can be powered "slightly" before the V_{CCA} without the current penalty, but this "setup time" is dependent on the power—up ramp rate of the V_{CC} pins. With a ramp rate of approximately V_{CCB} is V_{CCB} and V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} are V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} are V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} are V_{CCB} are V_{CCB} are V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} are V_{CCB} are V_{CCB} are V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB} and V_{CCB} are V_{CCB}

MOTOROLA

before V_{CCA}). With a $7V/\mu s$ rate, the setup time was about 140ns. When all is said and done, the safest power–up strategy is to simply power V_{CCA} before V_{CCB} . One more

note: if the V_{CCB} ramp rate is faster than the V_{CCA} ramp rate then power problems might still occur, even if the V_{CCA} power–up began prior to the V_{CCB} power–up.
