

CYPRESS

W40S11-23

Clock Buffer/Driver

Features

- Thirteen skew-controlled CMOS clock outputs (SDRAM0:12)
- Supports three SDRAM DIMMs
- Ideal for high-performance systems designed around Intel's latest chip set
- I²C serial configuration interface
- Clock Skew between any two outputs is less than 250 ps
- 1- to 5-ns propagation delay
- DC to 133-MHz operation
- Single 3.3V supply voltage
- Low power CMOS design packaged in a 28-pin, 300-mil SOIC (Small Outline Integrated Circuit)

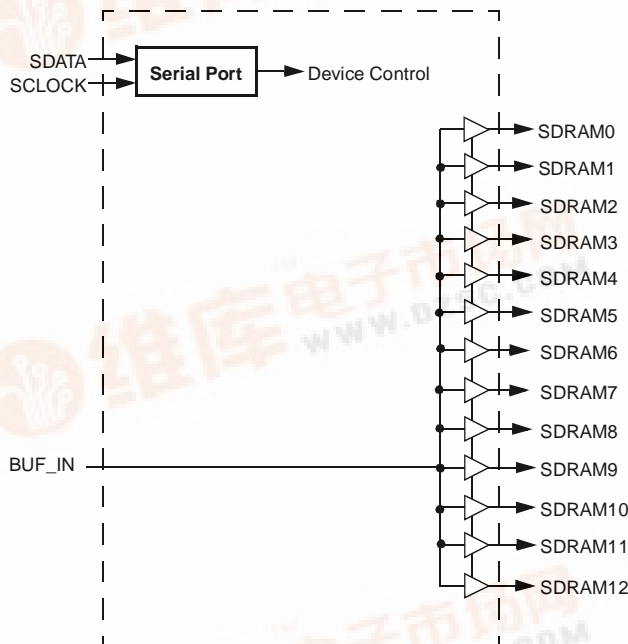

Overview

The Cypress W40S11-23 is a low-voltage, thirteen-output clock buffer. Output buffer impedance is approximately 15Ω, which is ideal for driving SDRAM DIMMs.

Key Specifications

Supply Voltages:..... $V_{DD} = 3.3V \pm 5\%$
 Operating Temperature:..... 0°C to +70°C
 Input Threshold: 1.5V typical
 Maximum Input Voltage: $V_{DD} + 0.5V$
 Input Frequency:..... 0 to 133 MHz
 BUF_IN to SDRAM0:12 Propagation Delay: 1.0 to 5.0 ns
 Output Edge Rate:..... $\geq 1.5 V/ns$
 Output Clock Skew: $\pm 250 ps$
 Output Duty Cycle: 45/55% worst case
 Output Impedance: 15Ω typical
 Output Type: CMOS rail-to-rail

Pin Definitions

Pin Name	Pin No.	Pin Type	Pin Description
SDRAM0:12	2, 3, 6, 7, 10, 11, 18, 19, 22, 23, 26, 27, 12	O	SDRAM Outputs: Provides buffered copy of BUF_IN. The propagation delay from a rising input edge to a rising output edge is 1 to 5 ns. All outputs are skew controlled to within ± 250 ps of each other.
BUF_IN	9	I	Clock Input: This clock input has an input threshold voltage of 1.5V (typ).
SDATA	14	I/O	I²C Data input: Data should be presented to this input as described in the I ² C section of this data sheet. Internal 250-k Ω pull-up resistor.
SCLOCK	15	I	I²C clock input: The I ² C data clock should be presented to this input as described in the I ² C section of this data sheet. Internal 250-k Ω pull-up resistor.
VDD	1, 5, 13, 20, 24, 28	P	Power Connection: Power supply for core logic and output buffers. Connected to 3.3V supply.
GND	4, 8, 16, 17, 21, 25	G	Ground Connection: Connect all ground pins to the common system ground plane.

Functional Description

Output Drivers

The W40S11-23 output buffers are CMOS type which deliver a rail-to-rail (GND to V_{DD}) output voltage swing into a nominal

capacitive load. Thus, output signaling is both TTL and CMOS level compatible. Nominal output buffer impedance is 15 Ω .

Operation

Data is written to the W40S11-23 in ten bytes of eight bits each. Bytes are written in the order shown in *Table 1*.

Table 1. Byte Writing Sequence

Byte Sequence	Byte Name	Bit Sequence	Byte Description
1	Slave Address	11010010	Commands the W40S11-23 to accept the bits in Data Bytes 0–6 for internal register configuration. Since other devices may exist on the same common serial data bus, it is necessary to have a specific slave address for each potential receiver. The slave receiver address for the W40S11-23 is 11010010. Register setting will not be made if the Slave Address is not correct (or is for an alternate slave receiver).
2	Command Code	Don't Care	Unused by the W40S11-23, therefore bit values are ignored (don't care). This byte must be included in the data write sequence to maintain proper byte allocation. The Command Code Byte is part of the standard serial communication protocol and may be used when writing to another addressed slave receiver on the serial data bus.
3	Byte Count	Don't Care	Unused by the W40S11-23, therefore bit values are ignored (don't care). This byte must be included in the data write sequence to maintain proper byte allocation. The Byte Count Byte is part of the standard serial communication protocol and may be used when writing to another addressed slave receiver on the serial data bus.
4	Data Byte 0	Refer to <i>Table 2</i>	The data bits in these bytes set internal W40S11-23 registers that control device operation. The data bits are only accepted when the Address Byte bit sequence is 11010010, as noted above. For description of bit control functions, refer to <i>Table 2</i> , Data Byte Serial Configuration Map.

Writing Data Bytes

Each bit in the data bytes control a particular device function. Bits are written MSB (most significant bit) first, which is bit 7.

Table 2 gives the bit formats for registers located in Data Bytes 0–6.

- At power-up all SDRAM outputs are enabled and active. Program Reserved bits to a "0."

How To Use the Serial Data Interface

Electrical Requirements

Figure 1 illustrates electrical characteristics for the serial interface bus used with the W40S11-23. Devices send data over the bus with an open drain logic output that can (a) pull the bus line LOW, or (b) let the bus default to logic 1. The pull-up resistor on the bus (both clock and data lines) establish a default

logic 1. All bus devices generally have logic inputs to receive data.

Although the W40S11-23 is a receive-only device (no data write-back capability), it does transmit an “acknowledge” data pulse after each byte is received. Thus, the SDATA line can both transmit and receive data.

The pull-up resistor should be sized to meet the rise and fall times specified in AC parameters, taking into consideration total bus line capacitance.

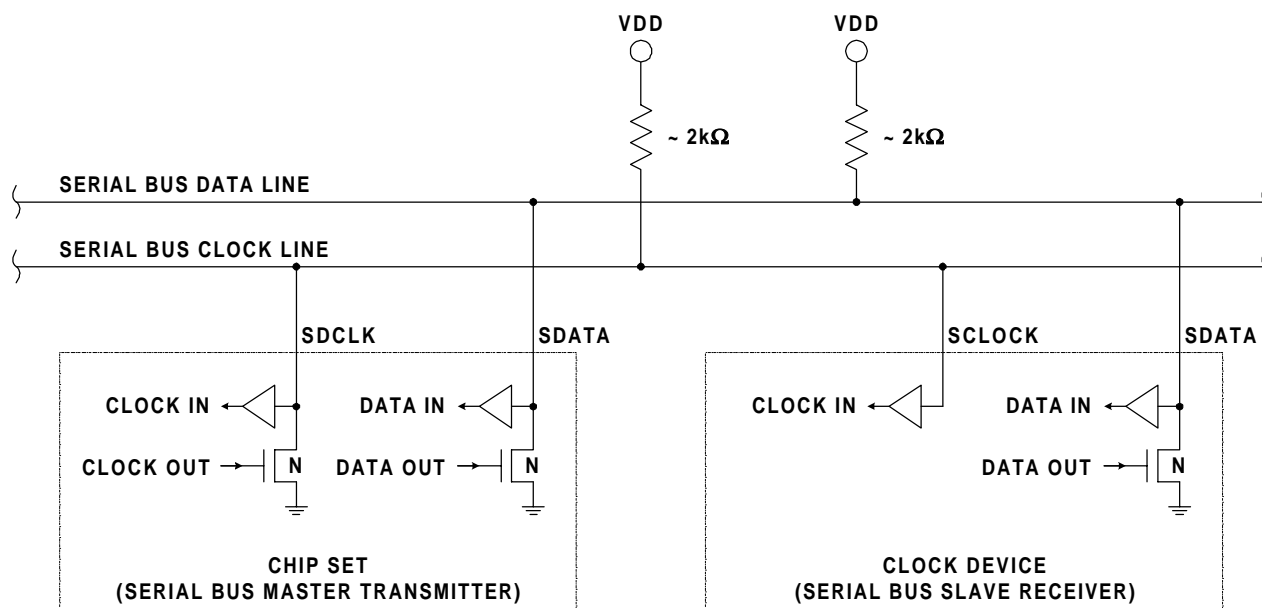

Figure 1. Serial Interface Bus Electrical Characteristics

Signaling Requirements

As shown in *Figure 2*, valid data bits are defined as stable logic 0 or 1 condition on the data line during a clock HIGH (logic 1) pulse. A transitioning data line during a clock HIGH pulse may be interpreted as a start or stop pulse (it will be interpreted as a start or stop pulse if the start/stop timing parameters are met).

A write sequence is initiated by a “start bit” as shown in *Figure 3*. A “stop bit” signifies that a transmission has ended.

As stated previously, the W40S11-23 sends an “acknowledge” pulse after receiving eight data bits in each byte as shown in *Figure 4*.
