Pin Definitions

| Pin Name | Pin No. | Pin Type | Pin Description |
|----------------------|--------------------------------------|----------|---|
| CPU0:3 | 40, 39, 36, 35 | O | CPU Clock Outputs 0 through 3: These four CPU clock outputs are controlled by the CPU_STOP# control pin. Output voltage swing is controlled by voltage applied to VDDQ2. |
| PCI1:7 | 8, 10, 11, 13, 14, 16, 17 | O | PCI Bus Clock Outputs 1 through 7: These seven PCI clock outputs are controlled by the PCI_STOP# control pin. Output voltage swing is controlled by voltage applied to VDDQ3. |
| PCI_F | 7 | O | Fixed PCI Clock Output: Unlike PCI1:7 outputs, this output is not controlled by the PCI_STOP# control pin. Output voltage swing is controlled by voltage applied to VDDQ3. |
| CPU_STOP# | 30 | I | CPU_STOP# Input: When brought LOW, clock outputs CPU0:3 are stopped LOW after completing a full clock cycle (2–3 CPU clock latency). When brought HIGH, clock outputs CPU0:3 start beginning with a full clock cycle (2–3 CPU clock latency). |
| PCI_STOP# | 31 | I | PCI_STOP# Input: The PCI_STOP# input enables the PCI 1:7 outputs when HIGH and causes them to remain at logic 0 when LOW. The PCI_STOP signal is latched on the rising edge of PCI_F. Its effects take place on the next PCI_F clock cycle. |
| SPREAD# | 28 | I | SPREAD# Input: When brought LOW this pin activates Spread Spectrum clocking. |
| APIC0:1 | 45, 44 | O | I/O APIC Clock Outputs: Provides 14.318-MHz fixed frequency. The output voltage swing is controlled by VDDQ2. |
| 48MHz | 22, 23 | O | 48-MHz Outputs: Fixed clock outputs at 48 MHz. Output voltage swing is controlled by voltage applied to VDDQ3. |
| REF0:2 | 1, 2, 47 | O | Fixed 14.318-MHz Outputs 0 through 2: Used for various system applications. Output voltage swing is controlled by voltage applied to VDDQ3. |
| SEL100/66# SEL1:0 | 25, 26, 27 | I | Frequency Selection Input: Selects power-up default CPU clock frequency as shown in <i>Table 1</i> on page 1. |

| PWR_DWN# | 29 | I | Power Down Control: When this input is LOW, device goes into a low-power condition. All outputs are held LOW while in power-down. CPU and PCI clock outputs are stopped LOW after completing a full clock cycle (2–3 CPU clock cycle latency). When brought HIGH, CPU, SDRAM and PCI outputs start with a full clock cycle at full operating frequency (3 ms maximum latency). |
| VDDQ3 | 9, 15, 19, 21, 33, 48 | P | Power Connection: Connect to 3.3V supply. |

Spread Spectrum Clocking

The device generates a clock that is frequency modulated in order to increase the bandwidth that it occupies. By increasing the bandwidth of the fundamental and its harmonics, the amplitudes of the radiated electromagnetic emissions are reduced. This effect is depicted in *Figure 1*.

As shown in *Figure 1*, a harmonic of a modulated clock has a much lower amplitude than that of an unmodulated signal. The reduction in amplitude is dependent on the harmonic number and the frequency deviation or spread. The equation for the reduction is:

$$dB = 6.5 + 9 \cdot \log_{10}(P) + 9 \cdot \log_{10}(F)$$

Where P is the percentage of deviation and F is the frequency in MHz where the reduction is measured.

The output clock is modulated with a waveform depicted in *Figure 2*. This waveform, as discussed in "Spread Spectrum Clock Generation for the Reduction of Radiated Emissions" by Bush, Fessler, and Hardin produces the maximum reduction in the amplitude of radiated electromagnetic emissions. The deviation selected for this chip is -0.5% , -1.0% , or $\pm 0.9\%$ of the selected frequency. *Figure 2* details the Cypress spreading pattern. Cypress does offer options with more spread and greater EMI reduction. Contact your local Sales representative for details on these devices.

Spread Spectrum clocking is activated or deactivated by selecting the appropriate values for SPREAD#.
