

Low Noise/Low Power/I²C Bus/256 Taps

The ISL90810 integrates a digitally controlled potentiometer (XDCP) on a monolithic CMOS integrated circuit.

The digitally controlled potentiometers are implemented with a combination of resistor elements and CMOS switches. The position of the wipers are controlled by the user through the I²C bus interface. Each potentiometer has an associated Wiper Register (WR) that can be directly written to and read by the user. The contents of the WR controls the position of the wiper.

The DCP can be used as three-terminal potentiometer or as two-terminal variable resistor in a wide variety of applications including control, parameter adjustments, and signal processing.

Ordering Information

PART NUMBER	PART MARKING	R _{TOTAL} (kΩ)	TEMP RANGE (°C)	PACKAGE
ISL90810WUIU8*	AJL	10	-40 to +85	8 Ld MSOP
ISL90810WUIU8Z* (Note)	DEN		-40 to +85	8 Ld MSOP (Pb-free)
ISL90810UIU8*	AJK	50	-40 to +85	8 Ld MSOP
ISL90810UIU8Z* (Note)	DEM		-40 to +85	8 Ld MSOP (Pb-free)

*Add "-TK" suffix for tape and reel.

NOTE: Intersil Pb-free plus anneal products employ special Pb-free material sets; molding compounds/die attach materials and 100% matte tin plate termination finish, which are RoHS compliant and compatible with both SnPb and Pb-free soldering operations. Intersil Pb-free products are MSL classified at Pb-free peak reflow temperatures that meet or exceed the Pb-free requirements of IPC/JEDEC J STD-020.

Features

- 256 resistor taps - 0.4% resolution
- I²C serial interface
- Wiper resistance: 70Ω typical @ 3.3V
- Standby current 5μA max
- Power supply: 2.7V to 5.5V
- 50kΩ, 10kΩ total resistance
- 8 Ld MSOP
- Pb-free plus anneal available (RoHS compliant)

SDA vs SCL Timing

NOTES:

1. Typical values are for $T_A = 25^\circ\text{C}$ and 3.3V supply voltage.
2. LSB: $[V(RW)_{255} - V(RW)_0]/255$. $V(RW)_{255}$ and $V(RW)_0$ are $V(RW)$ for the DCP register set to FF hex and 00 hex respectively. LSB is the incremental voltage when changing from one tap to an adjacent tap.
3. ZS error = $V(RW)_0/\text{LSB}$.
4. FS error = $[V(RW)_{255} - V_{CC}]/\text{LSB}$.
5. DNL = $[V(RW)_i - V(RW)_{i-1}]/\text{LSB} - 1$, for $i = 1$ to 255. i is the DCP register setting.
6. INL = $(V(RW)_i - i \cdot \text{LSB} - V(RW)_0)/\text{LSB}$, for $i = 1$ to 255.
7. $TC_V = \frac{\text{Max}(V(RW)_i) - \text{Min}(V(RW)_i)}{[\text{Max}(V(RW)_i) + \text{Min}(V(RW)_i)]/2} \times \frac{10^6}{125^\circ\text{C}}$ for $i = 16$ to 240 decimal, $T = -40^\circ\text{C}$ to 85°C . $\text{Max}()$ is the maximum value of the wiper voltage and $\text{Min}()$ is the minimum value of the wiper voltage over the temperature range.
8. $MI = |R_{255} - R_0|/255$. R_{255} and R_0 are the measured resistances for the DCP register set to FF hex and 00 hex respectively. $\text{Roffset} = R_0/MI$, when measuring between RW and RL.
9. $\text{Roffset} = R_{255}/MI$, when measuring between RW and RH.
10. $RDNL = (R_i - R_{i-1})/MI$, for $i = 32$ to 255.
11. $RINL = [R_i - (MI \cdot i) - R_0]/MI$, for $i = 32$ to 255.
12. $TC_R = \frac{[\text{Max}(R_i) - \text{Min}(R_i)]}{[\text{Max}(R_i) + \text{Min}(R_i)]/2} \times \frac{10^6}{125^\circ\text{C}}$ for $i = 32$ to 255, $T = -40^\circ\text{C}$ to 85°C . $\text{Max}()$ is the maximum value of the resistance and $\text{Min}()$ is the minimum value of the resistance over the temperature range.
13. This parameter is not 100% tested.

Principles of Operation

The ISL90810 is an integrated circuit incorporating one DCP with its associated registers, and an I²C serial interface providing direct communication between a host and the potentiometers.

DCP Description

The DCP is implemented with a combination of resistor elements and CMOS switches. The physical ends of the DCP are equivalent to the fixed terminals of a mechanical potentiometer (RH and RL pins). The RW pin of the DCP is connected to intermediate nodes, and is equivalent to the wiper terminal of a mechanical potentiometer. The position of the wiper terminal within the DCP is controlled by an 8-bit volatile Wiper Register (WR). When the WR of the DCP contains all zeroes (WR<7:0>: 00h), its wiper terminal (RW) is closest to its “Low” terminal (RL). When the WR of the DCP contains all ones (WR<7:0>: FFh), its wiper terminal (RW) is closest to its “High” terminal (RH). As the value of the WR increases from all zeroes (00h) to all ones (255 decimal), the wiper moves monotonically from the position closest to RL to the closest to RH. At the same time, the resistance between RW and RL increases monotonically, while the resistance between RH and RW decreases monotonically.

While the ISL90810 is being powered up, The WR is reset to 80h (128 decimal), which locates RW roughly at the center between RL and RH.

The WR can be read or written to directly using the I²C serial interface as described in the following sections. The I²C interface Address Byte has to be set to 00hex to access the WR.

I²C Serial Interface

The ISL90810 supports a bidirectional bus oriented protocol. The protocol defines any device that sends data onto the bus as a transmitter and the receiving device as the receiver. The device controlling the transfer is a master and the device being controlled is the slave. The master always initiates data transfers and provides the clock for both transmit and receive operations. Therefore, the ISL90810 operates as a slave device in all applications.

All communication over the I²C interface is conducted by sending the MSB of each byte of data first.

Protocol Conventions

Data states on the SDA line must change only during SCL LOW periods. SDA state changes during SCL HIGH are reserved for indicating START and STOP conditions (See Figure 15). On power-up of the ISL90810 the SDA pin is in the input mode.

All I²C interface operations must begin with a START condition, which is a HIGH to LOW transition of SDA while SCL is HIGH. The ISL90810 continuously monitors the SDA and SCL lines for the START condition and does not respond to any command until this condition is met (See Figure 15). A START condition is ignored during the power-up for the device.

All I²C interface operations must be terminated by a STOP condition, which is a LOW to HIGH transition of SDA while SCL is HIGH (See Figure 15) A STOP condition at the end of a read operation, or at the end of a write operation places the device in its standby mode.

An ACK, Acknowledge, is a software convention used to indicate a successful data transfer. The transmitting device, either master or slave, releases the SDA bus after transmitting eight bits. During the ninth clock cycle, the receiver pulls the SDA line LOW to acknowledge the reception of the eight bits of data (See Figure 16).

The ISL90810 responds with an ACK after recognition of a START condition followed by a valid Identification Byte, and once again after successful receipt of an Address Byte. The ISL90810 also responds with an ACK after receiving a Data Byte of a write operation. The master must respond with an ACK after receiving a Data Byte of a read operation.

A valid Identification Byte contains 0101000 as the seven MSBs. The LSB is the Read/Write bit. Its value is "1" for a Read operation, and "0" for a Write operation (See Table 2)

The address byte is set to 00h and follows the identification byte. Read and write operations always point to address 00h, indicating the WR for the device.

TABLE 1. IDENTIFICATION BYTE FORMAT

0	1	0	1	0	0	0	R/W
(MSB)							(LSB)

Write Operation

A Write operation requires a START condition, followed by a valid Identification Byte, a valid Address Byte, a Data Byte, and a STOP condition. After each of the three bytes, the ISL90810 responds with an ACK. At this time the device enters its standby state (See Figure 17).

Data Protection

A valid Identification Byte, Address Byte, and total number of SCL pulses act as a protection for the registers. During a Write sequence, the Data Byte is loaded into an internal shift register as it is received. The Data Byte is transferred to the Wiper Register (WR) at the falling edge of the SCL pulse that loads the last bit (LSB) of the Data Byte.

Read Operation

A Read operation consists of a three byte instruction followed by one Data Byte (See Figure 18). The master initiates the operation issuing the following sequence: a START, the identification byte with the R/W bit set to "0", an Address Byte, a second START, and a second Identification byte with the R/W bit set to "1". After each of the three bytes, the ISL90810 responds with an ACK. The the ISL90810 transmits Data Bytes as long as the master responds with an ACK during the SCL cycle following the eighth bit of each byte. The master terminates the read operation (issuing a ACK and a STOP condition) following the last bit of the Data Byte (See Figure 18).
