# 5-Output Power-Management IC For Low-Cost PDAs

MAX1559

## General Description

The MAX1559 is a complete power-management chip for low-cost personal digital assistants (PDAs) and portable devices operating from a 1-cell lithium-ion (Li+) or 3-cell NiMH battery. It includes all the regulators, outputs, and voltage monitors necessary for small PDAs while requiring a bare minimum of external components. Featured are four linear regulators, a DC-DC boost converter for LCD bias, a microprocessor reset output, and low-battery shutdown in a miniature QFN package. For a compatible Li+ charger for both USB and AC adapter inputs, refer to the MAX1551\*.

The four linear regulators feature PMOS pass elements for efficient low-dropout operation. A MAIN LDO supplies 3.3V at 500mA. A signal-detect (SD) card-slot output supplies 3.3V at 400mA. The COR1 LDO outputs 1V at 250mA, and the COR2 LDO supplies 1.8V at 30mA. The SD output and COR2 LDO have pin-controlled shutdown. For other output-voltage combinations, contact Maxim.

The DC-DC boost converter features an on-board MOSFET and True Shutdown™ when off. This means that during shutdown, input power is disconnected from the inductor so that the boost output falls to 0V rather than remaining one diode drop below the input voltage.

A  $\mu\text{P}$  reset output clears when the MAIN LDO achieves regulation to ensure an orderly start. Thermal shutdown protects the die from overheating.

The MAX1559 operates from a 3.1V to 5.5V supply and consumes 50mA of no-load supply current. It is packaged in a 1.3W, 16-pin thin QFN with a power pad on the underside of the package. The MAX1559 is specified for operation from -40°C to +85°C.

## Applications

- PDAs
- Organizers
- Cellular and Cordless Phones
- MP3 Players
- Hand-Held Devices

True Shutdown is a trademark of Maxim Integrated Products, Inc.

\*Protected by U.S. Patent #6,507,172.

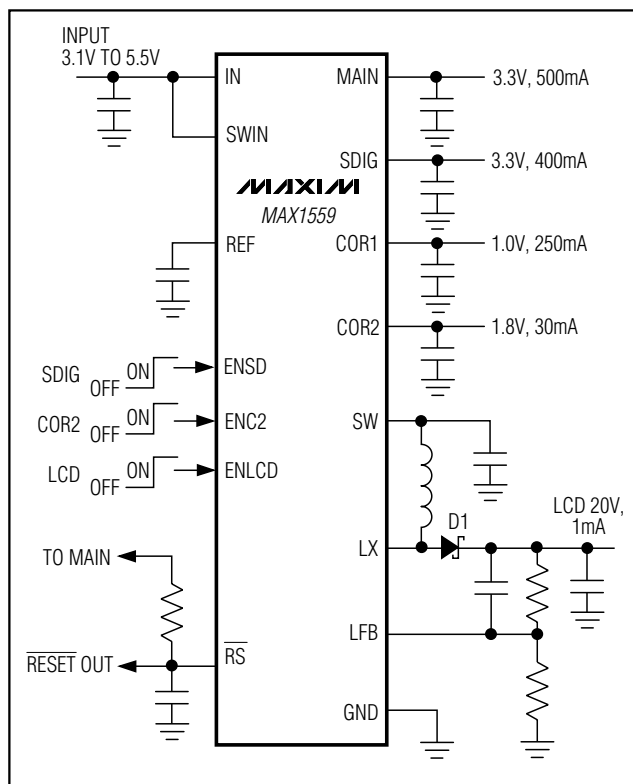

## Features

- ◆ Minimal External Components
- ◆ 3.3V, 500mA MAIN LDO
- ◆ 3.3V, 400mA SD Card Output
- ◆ 1V, 250mA Core LDO
- ◆ 1.8V, 30mA Second Core LDO
- ◆ High-Efficiency LCD Boost
- ◆ LCD 0V True Shutdown when Off
- ◆ 50 $\mu\text{A}$  Quiescent Current
- ◆ 3.1V to 5.5V Input Range

## Ordering Information

PART	TEMP RANGE	PIN-PACKAGE
MAX1559ETE	-40°C to +85°C	16 Thin QFN

## Typical Operating Circuit

Pin Configuration appears at end of data sheet.

# 5-Output Power-Management IC For Low-Cost PDAs

## ABSOLUTE MAXIMUM RATINGS

IN, SWIN, ENSD, ENC2, ENLCD, $\overline{RS}$ , SDIG to GND .....	-0.3V to +6V
LX to GND .....	-0.3V to +30V
MAIN, COR1, COR2, REF, LFB to GND .....	-0.3V to ( $V_{IN} + 0.3V$ )
SWIN to IN .....	-0.3V to +0.3V
Current into LX or SWIN .....	300mA <sub>RMS</sub>
Current Out of SW .....	300mA <sub>RMS</sub>
Output Short-Circuit Duration .....	Continuous

Continuous Power Dissipation ( $T_A = +70^\circ\text{C}$ ) 16-Pin Thin QFN (derate 16.9mW/ $^\circ\text{C}$ above $+70^\circ\text{C}$ ) ...	1.349W
Operating Temperature Range .....	$-40^\circ\text{C}$ to $+85^\circ\text{C}$
Junction Temperature .....	$+150^\circ\text{C}$
Storage Temperature Range .....	$-65^\circ\text{C}$ to $+150^\circ\text{C}$
Lead Temperature (soldering, 10s) .....	$+300^\circ\text{C}$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## ELECTRICAL CHARACTERISTICS

## Pin Description

PIN		FUNCTION
1	COR1	1V, 250mA LDO Output for CPU Core. COR1 turns off when $V_{IN} < 3V$ or $MAIN < 3.1V$ .
2	IN	Input Voltage to the Device. Bypass to GND with a 1 $\mu$ F capacitor.
3	SDIG	3.3V, 400mA LDO Output for Secure Digital Card Slot. SDIG has reverse current protection so SDIG can be biased when no power is present at IN. SDIG output turns off when $V_{IN} < 3V$ or when ENSD goes low.
4	ENSD	SDIG Enable Input. Drive ENSD low to turn off SDIG and high to turn on. SDIG cannot be activated when $V_{IN} < 3V$ .
5	REF	1.25V Reference. Bypass with 0.1 $\mu$ F to GND.
6	$\overline{RS}$	Reset Output. $\overline{RS}$ is an active-low, open-drain output that goes low when $V_{MAIN}$ falls below 3.1V. $\overline{RS}$ deasserts when $V_{MAIN}$ goes above 3.2V. Connect a 1M $\Omega$ pullup resistor from $\overline{RS}$ to MAIN.
7	N.C.	Not Connected
8	GND	Ground
9	LX	LCD Boost Switch. Connect to a boost inductor and Schottky diode. See Figure 1.
10	SW	LCD True Shutdown Switch Output. SW is the power source for the boost inductor. SW turns on when ENLCD is high. For best efficiency, bypass SW with 4.7 $\mu$ F to GND.
11	SWIN	LCD True Shutdown Switch Input. The SWIN-to-SW switch turns off when ENLCD goes low or when $V_{IN} < 3V$ . Connect SWIN to IN.
12	LFB	LCD Feedback Input. Connect LFB to a resistor-divider network between the LCD output and GND. The feedback threshold is 1.25V.
13	ENLCD	Enable Input for LCD (Boost Regulator). Drive ENLCD high to activate the LCD boost. Drive ENLCD low to shut down the LCD output. The LCD cannot be activated when $V_{IN} < 3V$ .
14	ENC2	Enable Input for Secondary Core LDO (COR2). Drive ENC2 high to turn on COR2 and low to turn off. COR2 cannot be activated when $V_{IN} < 3V$ .
15	COR2	1.8V, 30mA LDO Output for Secondary Core. COR2 turns off when $V_{IN} < 3V$ or when ENC2 goes low.
16	MAIN	3.3V, 500mA LDO Output for Main Supply. MAIN output turns off when $V_{IN} < 3V$ .

## Detailed Description

### Linear Regulators

The MAX1559 contains all power blocks and voltage monitors for a small PDA. Power for logic and other subsystems are provided by four LDOs:

- MAIN—Provides 3.3V at a guaranteed 500mA with a typical current limit of 900mA.
- SDIG—Provides 3.3V at a guaranteed 400mA for secure digital cards with a typical current limit of 630mA.

- COR1—1V for CPU core guarantees 250mA and a typical current limit of 450mA.
- COR2—1.8V for CODEC core guarantees 30mA and a typical current limit of 50mA.

Note that it may not be possible to draw the rated current of MAIN and SDIG at all operating input voltages due to the dropout limitations of those regulators. The typical dropout resistance of the MAIN regulator is 0.7 $\Omega$  (350mV drop at 500mA), and the typical dropout resistance of the SDIG regulator is 0.85 $\Omega$  (340mV drop at 400mA).

## 5-Output Power-Management IC For Low-Cost PDAs

MAIN and COR1 regulators are always on as long as the IC is not in low-voltage shutdown ( $V_{IN} < 3V$ ). COR2 and SDIG can be turned on and off independently by logic signals at ENC2 and ENSD, respectively, but cannot be activated if  $V_{IN} < 3V$ .

When SDIG is turned off, reverse current is blocked so the SDIG output can be biased with an external source when no power is present at IN. Leakage current is typically  $3\mu A$  with 3.3V at SDIG.

### LCD DC-DC Boost

In addition to the LDOs, the MAX1559 also includes a low-current, high-voltage DC-DC boost converter for LCD bias. This circuit can output at up to 28V and can be adjusted with either an analog or PWM control signal using external components.

SW provides an input-power disconnect for the LCD when ENLCD is low (off). The input-power disconnect function is ideal for applications that require the output voltage to fall to 0V in shutdown (True Shutdown). If True Shutdown is not required, the SW switch can be bypassed by connecting the boost inductor directly to IN and removing the bypass cap on SW (C9 in Figure 1).

### System Sleep

All regulated outputs turn off when  $V_{IN}$  falls below 3V. The MAX1559 resumes normal operation when  $V_{IN}$  rises above 3.6V.

### Reset Output

Reset ( $\overline{RS}$ ) asserts when  $V_{MAIN}$  falls below 3.094V.  $\overline{RS}$  is an open-drain, active-low output. Connect a  $1M\Omega$  resistor from  $\overline{RS}$  to MAIN. To implement a reset deassertion delay, add a capacitor from  $\overline{RS}$  to GND. An approximate 10ms delay can be generated with  $1M\Omega$  and 22nF. This results in a 22ms time constant, but assumes the input threshold of the CPU reset input is approximately 1V and is reached approximately 10ms after  $\overline{RS}$  goes high impedance. Timing for  $\overline{RS}$ , 3.3V MAIN, and 1V COR1 is shown in Figure 3.

## Applications Information

### LDO Output Capacitors (MAIN, SDIG, COR1, and COR2)

Capacitors are required at each output of the MAX1559 for stable operation over the full load and temperature range. See Figure 1 for recommended capacitor values for each output. To reduce noise and improve load transients, large output capacitors at up to  $10\mu F$  can be used. Surface-mount ceramic capacitors have very low

ESR and are commonly available in values up to  $10\mu F$ . X7R and X5R dielectrics are recommended. Note that some ceramic dielectrics, such as Z5U and Y5V, exhibit large capacitance and ESR variation with temperature and require larger than the recommended values to maintain stability over temperature.

### LCD Boost Output

#### Selecting an Inductor

The LCD boost is designed to operate with a wide range of inductor values ( $4.7\mu H$  to  $22\mu H$ ). Smaller inductance values typically offer smaller size for a given series resistance or saturation current. Smaller values make LX switch more frequently for a given load and can reduce efficiency at low load currents. Larger values reduce switching losses due to less frequent switching for a given load, but higher resistance can then reduce efficiency. A  $10\mu H$  inductor provides a good balance and works well for most applications. The inductor's saturation current rating should be greater than the peak switching current (250mA); however, it is generally acceptable to bias some inductors into saturation by as much as 20%, although this slightly reduces efficiency.

#### Selecting a Diode

Schottky diodes rated at 250mA or more, such as the Motorola MBRS0530 or Nihon EP05Q03L are recommended. The diode reverse-breakdown voltage rating must be greater than the LCD output voltage.

#### Selecting Capacitors

For most applications, use a small  $1\mu F$  LCD output capacitor. This typically provides a peak-to-peak output ripple of 30mV. In addition, bypass IN with  $1\mu F$  and SW with  $4.7\mu F$  ceramic capacitors.

An LCD feed-forward capacitor, connected from the output to FB, improves stability over a wide range of battery voltages. A 10pF capacitor is sufficient for most applications; however, this value is also affected by PC board layout.

#### Setting the LCD Voltage

Adjust the output voltage by connecting a voltage-divider from the output ( $V_{OUT}$ ) to FB (Figure 1). Select R2 between  $10k\Omega$  and  $200k\Omega$ . Calculate R1 with the following equation:

$$R_1 = R_2 [(V_{OUT} / V_{FB}) - 1]$$

where  $V_{FB} = 1.25V$  and  $V_{OUT}$  can range from  $V_{IN}$  to 28V. The input bias current of FB is typically only 5nA, which allows large-value resistors to be used. For less

# 5-Output Power-Management IC For Low-Cost PDAs

Figure 1. Typical Operating Circuit with Charger and External PWM LCD Control

than 1% error, the current through R2 should be greater than 100 times the feedback input bias current (IFB).

### LCD Adjustment

The LCD boost output can be digitally adjusted by either a DAC or PWM signal.

### DAC Adjustment

Adding a DAC and a resistor,  $R_D$ , to the divider-circuit (Figure 4) provides DAC adjustment of  $V_{OUT}$ . Ensure that  $V_{OUT(MAX)}$  does not exceed the LCD panel rating. The output voltage ( $V_{OUT}$ ) as a function of the DAC

voltage ( $V_{DOUT}$ ) can be calculated using the following formula:

$$V_{OUT} = V_{REF} \left( 1 + \left( \frac{R_1}{R_2} \right) \right) + \frac{(V_{REF} - V_{DOUT})R_1}{R_D}$$

### Using a PWM Signal

Many microprocessors have the ability to create PWM outputs. These are digital outputs, based on either 16-bit or 8-bit counters, with a programmable duty cycle. In many applications, they are suitable for adjusting the output of the MAX1559 as seen in Figure 1.

# 5-Output Power-Management IC For Low-Cost PDAs

**MAX1559**

Figure 2. Functional Diagram

The circuit consists of the PWM source, capacitor C10, and resistors R<sub>D</sub> and R<sub>W</sub>. To analyze the transfer function of the PWM circuit, it is easiest to first simplify it to its Thevenin equivalent. The Thevenin voltage can be calculated using the following formula:

$$V_{THEV} = (D \times V_{OH}) + (1 - D) \times V_{OL}$$

where D is the duty cycle of the PWM signal, V<sub>OH</sub> is the PWM output high level (often 3.3V), and V<sub>OL</sub> is the PWM output low level (usually 0V). For CMOS logic, this equation simplifies to:

$$V_{THEV} = D \times V_{DD}$$

## 5-Output Power-Management IC For Low-Cost PDAs

where  $V_{DD}$  is the I/O voltage of the PWM output. The Thevenin impedance is the sum of resistors  $R_W$  and  $R_D$ :

$$R_{THEV} = R_D + R_W$$

The output voltage ( $V_{OUT}$ ) as a function of the PWM average voltage ( $V_{THEV}$ ) is:

$$V_{OUT} = V_{REF} \times \left( 1 + \frac{R_1}{R_2} \right) + \frac{(V_{REF} - V_{THEV}) \times R_1}{R_{THEV}}$$

When using the PWM adjustment method,  $R_D$  isolates the capacitor from the feedback loop of the MAX1559. The cutoff frequency of the lowpass filter is defined as:

$$f_C = \frac{1}{2 \times \pi \times R_{THEV} \times C}$$

The cutoff frequency should be at least 2 decades below the PWM frequency to minimize the induced AC ripple at the output.

An important consideration is the turn-on transient created by the initial charge on the filter capacitor  $C_{10}$ . This capacitor forms a time constant with  $R_{THEV}$ , which causes the output to initialize at a higher than intended voltage. This overshoot can be minimized by scaling  $R_D$  as high as possible compared to  $R_1$  and  $R_2$ . Alternately, the  $\mu P$  can briefly keep the LCD disabled until the PWM voltage has had time to stabilize.

### PC Board Layout and Grounding

Careful PC board layout is important for minimizing ground bounce and noise. Keep the MAX1559's ground pin and the ground leads of the input and output capacitors less than 0.2in (5mm) apart. In addition, keep all connections to FB and LX as short as possible. In particular, external feedback resistors should be as close to FB as possible. To minimize output voltage ripple and to maximize output power and efficiency, use a ground plane and solder GND directly to the ground plane. Refer to the MAX1559 evaluation kit for a layout example.

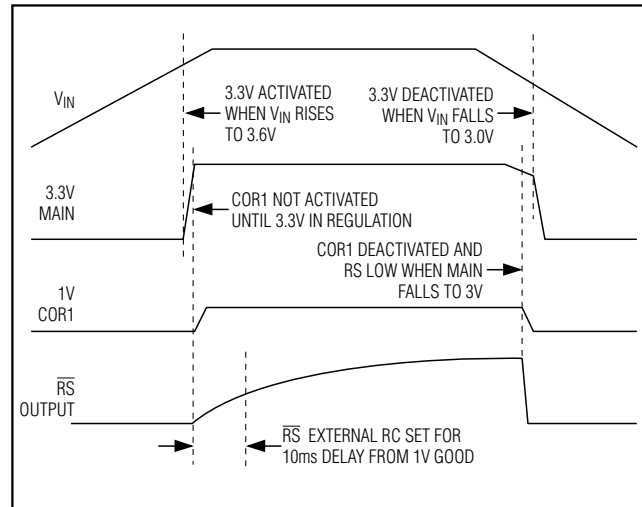

Figure 3.  $\overline{RS}$  and Power-On, Power-Off Timing for 3.3V and 1V Core

### Thermal Considerations

In most applications, the circuit is located on a multilayer board and full use of the four or more layers is recommended. For heat dissipation, connect the exposed backside pad of the QFN package to a large analog ground plane, preferably on a surface of the board that receives good airflow. Typical applications use multiple ground planes to minimize thermal resistance. Avoid large AC currents through the analog ground plane.

# 5-Output Power-Management IC For Low-Cost PDAs

**MAX1559**

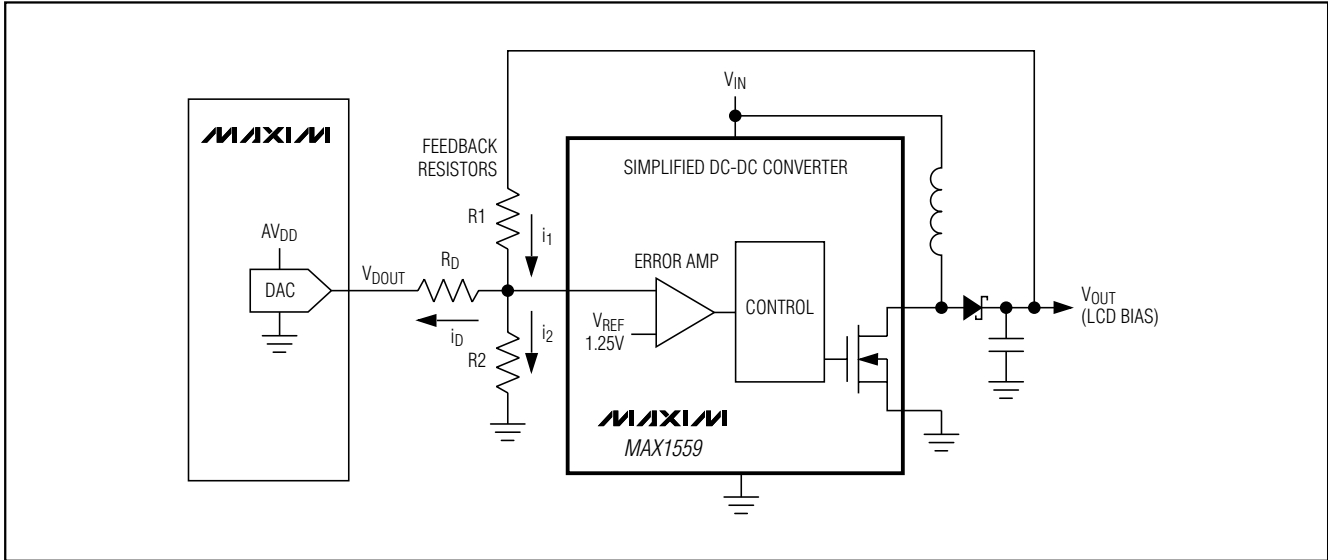

Figure 4. Adjusting the Output Voltage with a DAC

## Pin Configuration

## Chip Information

PROCESS: BiCMOS  
TRANSISTOR COUNT: 1872

# 5-Output Power-Management IC For Low-Cost PDAs

## Package Information

(The package drawing(s) in this data sheet may not reflect the most current specifications. For the latest package outline information, go to [www.maxim-ic.com/packages](http://www.maxim-ic.com/packages).)

COMMON DIMENSIONS												EXPOSED PAD VARIATIONS

NOTES:

- DIMENSIONING & TOLERANCING CONFORM TO ASME Y14.5M-1994.
- ALL DIMENSIONS ARE IN MILLIMETERS. ANGLES ARE IN DEGREES.
- N IS THE TOTAL NUMBER OF TERMINALS.

△ THE TERMINAL #1 IDENTIFIER AND TERMINAL NUMBERING CONVENTION SHALL CONFORM TO JEDEC 95-1 SPF-012. DETAILS OF TERMINAL #1 IDENTIFIER ARE OPTIONAL, BUT MUST BE LOCATED WITHIN THE ZONE INDICATED. THE TERMINAL #1 IDENTIFIER MAY BE EITHER A MOLD OR MARKED FEATURE.

△ DIMENSION b APPLIES TO METALLIZED TERMINAL AND IS MEASURED BETWEEN 0.25 mm AND 0.30 mm FROM TERMINAL TIP.

△ ND AND NE REFER TO THE NUMBER OF TERMINALS ON EACH D AND E SIDE RESPECTIVELY.

7. DEPOPULATION IS POSSIBLE IN A SYMMETRICAL FASHION.

△ COPLANARITY APPLIES TO THE EXPOSED HEAT SINK SLUG AS WELL AS THE TERMINALS.

9. DRAWING CONFORMS TO JEDEC MO220.

Maxim cannot assume responsibility for use of any circuitry other than circuitry entirely embodied in a Maxim product. No circuit patent licenses are implied. Maxim reserves the right to change the circuitry and specifications without notice at any time.
