## Single/Dual/Quad, 10MHz Single-Supply Op Amps

### General Description

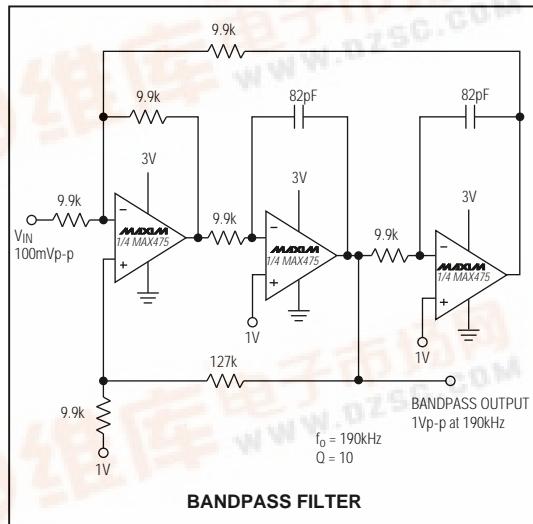

The single MAX473, dual MAX474, and quad MAX475 are single-supply (2.7V to 5.25V), unity-gain-stable op amps with rail-to-rail output swing. Each op amp guarantees a 10MHz unity-gain bandwidth, 15V/ $\mu$ s slew rate, and 600 $\Omega$  drive capability while typically consuming only 2mA supply current. In addition, the input range includes the negative supply rail and the output swings to within 50mV of each supply rail.

Single-supply operation makes these devices ideal for low-power and low-voltage portable applications. With their fast slew rate and settling time, they can replace higher-current op amps in large-signal applications. The MAX473/MAX474/MAX475 are available in DIP and SO packages in the industry-standard op-amp pin configurations. The MAX473 and MAX474 are also offered in the  $\mu$ MAX package, the smallest 8-pin SO.

### Applications

- Portable Equipment
- Battery-Powered Instruments
- Signal Processing
- Discrete Filters
- Signal Conditioning
- Servo-Loops

### Typical Operating Circuit

### Features

- ◆ 15V/ $\mu$ s Min Slew Rate
- ◆ +3V Single-Supply Operation
- ◆ Guaranteed 10MHz Unity-Gain Bandwidth
- ◆ 2mA Supply Current per Amplifier
- ◆ Input Range Includes Negative Rail
- ◆ Outputs Short-Circuit Protected
- ◆ Rail-to-Rail Output Swing (to within  $\pm 50\text{mV}$ )
- ◆  $\mu$ MAX Package (the smallest 8-pin SO)

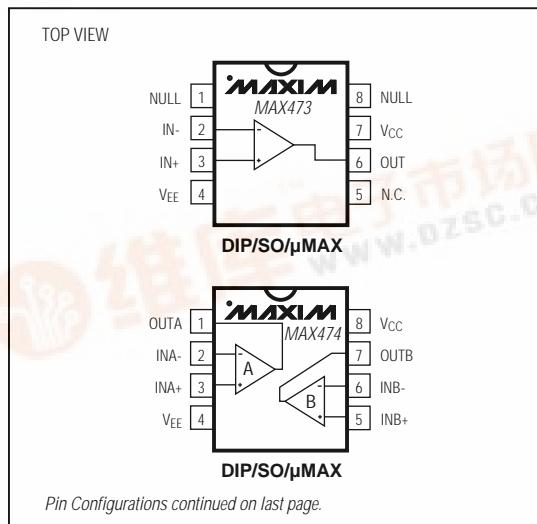

### Ordering Information

PART	TEMP. RANGE	PIN-PACKAGE
MAX473CPA	0°C to +70°C	8 Plastic DIP
MAX473CSA	0°C to +70°C	8 SO
MAX473CUA	0°C to +70°C	8 $\mu$ MAX
MAX473C/D	0°C to +70°C	Dice*
MAX473EPA	-40°C to +85°C	8 Plastic DIP
MAX473ESA	-40°C to +85°C	8 SO
MAX473MJA	-55°C to +125°C	8 CERDIP

### Ordering Information continued on last page.

\* Dice are specified at  $T_A = +25^\circ\text{C}$ , DC parameters only.

Lead Temperature (soldering, 10sec) .....	
	$+300^\circ C$

Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those indicated in the operational sections of the specifications is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## Single/Dual/Quad, 10MHz Single-Supply Op Amps

### Pin Description

PIN			NAME	FUNCTION
MAX473	MAX474	MAX475		
1, 8	—	—	NULL	Offset Null Input. Connect to one end of 2kΩ potentiometer for offset voltage trimming. Connect wiper to VEE. See Figure 1.
—	1	1	OUTA	Amplifier A Output
2	—	—	IN-	Inverting Input
—	2	2	INA-	Amplifier A Inverting Input
3	—	—	IN+	Noninverting Input
—	3	3	INA+	Amplifier A Noninverting Input
4	4	11	VEE	Negative Power-Supply Pin. Connect to ground or a negative voltage.
5	—	—	N.C.	No Connect—not internally connected
—	5	5	INB+	Amplifier B Noninverting Input
6	—	—	OUT	Amplifier Output
—	6	6	INB-	Amplifier B Inverting Input
—	7	7	OUTB	Amplifier B Output
7	8	4	Vcc	Positive Power-Supply Pin. Connect to (+) terminal of power supply.
—	—	8	OUTC	Amplifier C Output
—	—	9	INC-	Amplifier C Inverting Input
—	—	10	INC+	Amplifier C Noninverting Input
—	—	12	IND+	Amplifier D Noninverting Input
—	—	13	IND-	Amplifier D Inverting Input
—	—	14	OUTD	Amplifier D Output

### Applications Information

#### Power Supplies

The MAX473/MAX474/MAX475 operate from a single 2.7V to 5.25V power supply, or from dual supplies of  $\pm 1.35V$  to  $\pm 2.625V$ . For single-supply operation, bypass the power supply with  $0.1\mu F$ . If operating from dual supplies, bypass each supply to ground. With  $0.1\mu F$  bypass capacitance, channel separation (MAX474/MAX475) is typically better than 120dB with signal frequencies up to 300kHz. Increasing the bypass capacitance (e.g.  $10\mu F \parallel 0.1\mu F$ ) maintains channel separation at higher frequencies.

#### Minimizing Offsets

The MAX473's maximum offset voltage is  $\pm 2mV$  ( $T_A = +25^\circ C$ ). If additional offset adjustment is required, connect a  $2k\Omega$  trim potentiometer between pins 1, 8, and 4 (Figure 1). Input offset voltage for the dual MAX474 and quad MAX475 cannot be externally trimmed.

The MAX473/MAX474/MAX475 are bipolar op amps with low input bias currents. The bias currents at both inputs flow out of the device. Matching the resistance at the op amp's inputs significantly reduces the offset error caused by the bias currents. Place a resistor ( $R_3$ ) from the noninverting input to ground when using the inverting configuration (Figure 2a); place  $R_3$  in series with the noninverting input when using the noninverting configuration (Figure 2b). Select  $R_3$  such that the parallel combination of  $R_2$  and  $R_1$  equals  $R_3$ . Adding  $R_3$  will slightly increase the op amp's voltage noise.

#### Output Loading and Stability

The MAX473/MAX474/MAX475 op amps are unity-gain stable. Any op amp's stability depends on the configuration, closed-loop gain, and load capacitance. The unity-gain, noninverting buffer is the most sensitive gain configuration, and driving capacitive loads decreases stability.

## Single/Dual/Quad, 10MHz Single-Supply Op Amps

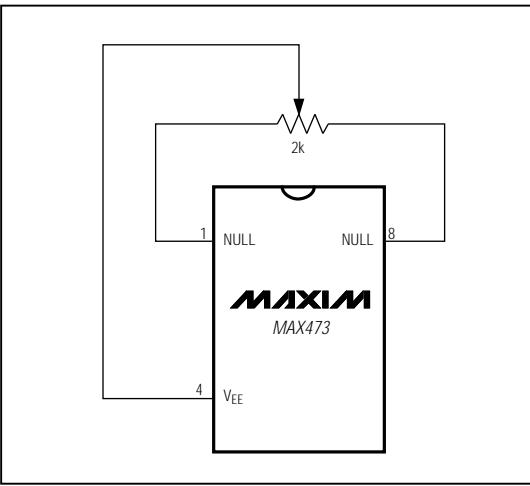

Figure 1. Offset Null Circuit

The MAX473/MAX474/MAX475 have excellent phase margin (the difference between 180° and the unity-gain phase angle). It is typically 63° with a load of 10kΩ in parallel with 20pF. Generally, higher phase margins indicate greater stability.

Capacitive loads form an RC network with the op amp's output resistance, causing additional phase shift that reduces the phase margin. Figure 3 shows the MAX473/MAX474/MAX475 output response when driving a 390pF load in parallel with 10kΩ.

When driving large capacitive loads, add an output isolation resistor, as shown in Figure 4. This resistor improves the phase margin by isolating the load capacitance from the amplifier output. Figure 5 shows the MAX473/MAX474/MAX475 driving a capacitive load of 1000pF using the circuit of Figure 4.

### Feedback Resistors

The feedback resistors appear as a resistance network to the op amp's feedback input (Figure 2). This resistance, combined with the op amp's input and stray capacitance (total input capacitance), forms a pole that adds unwanted phase shift when either the total input capacitance or feedback resistance is too large. For example, using the noninverting configuration with a gain of 10, if the total capacitance at the negative input is 10pF and the effective resistance ( $R_1 \parallel R_2$ ) is 9kΩ, this RC network introduces a pole at  $f_0 = 1.8\text{MHz}$ . At

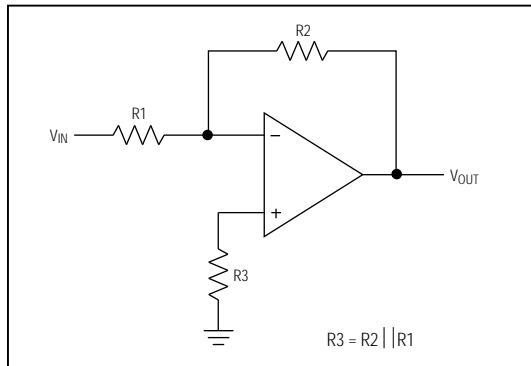

Figure 2a. Reducing Offset Error Due to Bias Current:  
Inverting Configuration

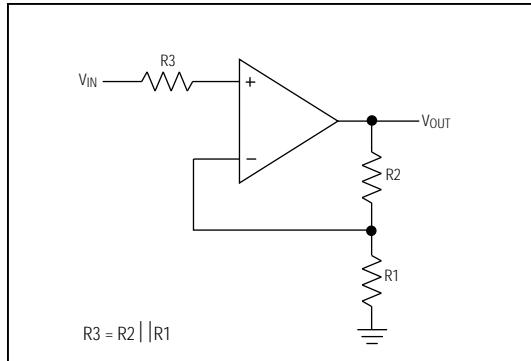

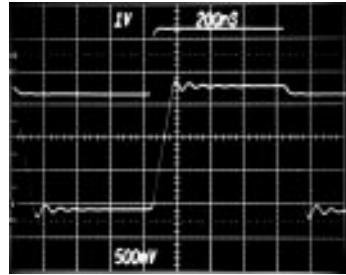

Figure 2b. Reducing Offset Error Due to Bias Current:  
Noninverting Configuration

input frequencies above  $f_0$ , the pole introduces additional phase shift, which reduces the overall bandwidth and adversely affects stability. Choose feedback resistors small enough so they do not adversely affect the op amp's operation at the frequencies of interest.

### Overdriving the Outputs

The output voltage swing for specified operation is from (VEE + 0.3V) to (Vcc - 0.5V) (see Electrical Characteristics). Exercising the outputs beyond these limits drives the output transistors toward saturation, resulting in bandwidth degradation, response-time increase, and gain decrease (which affects linearity). Operation in this region causes a slight distortion in the output waveform, but does not adversely affect the op amp.

## Single/Dual/Quad, 10MHz Single-Supply Op Amps

V<sub>CC</sub> = 5V, buffer configuration

Figure 3. MAX474 Driving 390pF

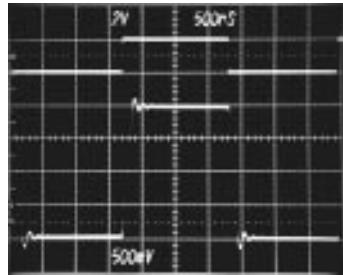

Figure 5. The MAX473 easily drives 1000pF using the Capacitive-Load Driving Circuit (Figure 4).

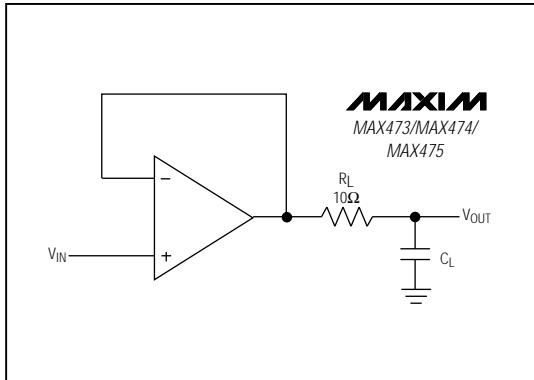

Figure 4. Capacitive-Load Driving Circuit

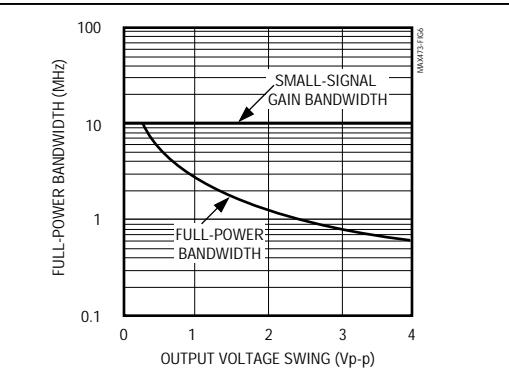

Figure 6. Full-Power Bandwidth vs. Peak-to-Peak AC Voltage

### Full-Power Bandwidth

The MAX473/MAX474/MAX475's fast 15V/ $\mu$ s slew rate maximizes full-power bandwidth (FPBW). The FFBW is given by:

$$\text{FPBW (Hz)} = \frac{\text{SR}}{\pi [\text{V}_{\text{OUT}} \text{ peak-to-peak(max)}]}$$

where the slew rate (SR) is 15V/ $\mu$ s min. Figure 6 shows the full-power bandwidth as a function of the peak-to-peak AC output voltage.

### Layout

A good layout improves performance by decreasing the amount of stray capacitance at the amplifier's inputs and output. Since stray capacitance might be unavoidable, minimize trace lengths and resistor leads, and place external components as close to the pins as possible.
