

SONY

CXA1538M/N/S

FM Stereo/AM Radio

Description

The CXA1538M/N/S is high performance one-chip bipolar ICs designed for FM stereo/AM radios. These include an FM/AM front end, FM/AM IF amplifier, FM/AM detection output and FM stereo demodulator output.

Features

- Low current consumption
(In FM mode $I_D=11.0$ mA, in AM mode 8.5 mA, $V_{CC}=6.0$ V)
- Built-in LED drive circuit for tuning
- Built-in LED drive circuit for stereo indicator
- Built-in muting circuit for the FM band
- Few external parts

Absolute Maximum Ratings ($T_a=25^\circ\text{C}$)

• Supply voltage	V_{CC}	14	V
• Operating temperature	T_{opr}	-10 to +60	$^\circ\text{C}$
• Storage temperature	T_{stg}	-55 to +150	$^\circ\text{C}$
• Junction temperature	T_{jmax}	125	$^\circ\text{C}$
• Allowable power dissipation	P_D		
	CXA1538M	500	mW
	CXA1538N	410	mW
	CXA1538S	1050	mW

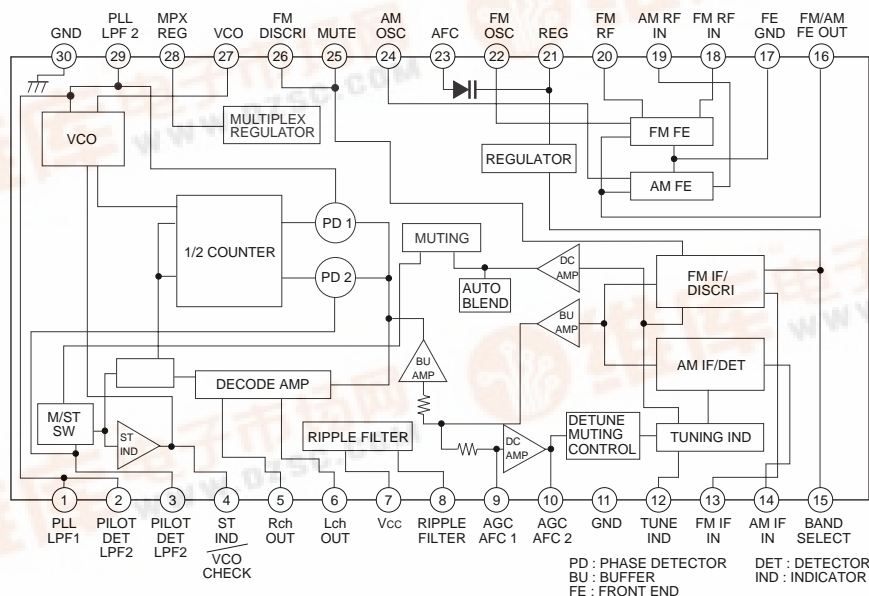

Recommended Operating Conditions

Supply voltage	V_{CC}	2 to 9	V
----------------	----------	--------	---

Structure

Bipolar silicon monolithic IC

Notes on Usage

1. VCO free run frequency adjustment method

As this IC has built-in oscillation capacitance, the oscillation frequency can be controlled with an external resistor.

1) VCO Adjustment Method

Pin 4 is the stereo indicator and VCO check pin. Therefore, in stereo mode (when stereo indicator drive Tr Q2 is switched on), pin 4 voltage lowers down, Q1 is cut off and VCO oscillation waveform can not be seen. In AM mode as well, the oscillation waveform can not be seen as VCO turns off. Adjust the free run frequency at 76 kHz \pm 50 Hz.

In this IC, tuner and MPX sections are directly connected. Therefore, free run frequency is not stable, being affected by noise except in reception mode. For free run adjustment, input signals from either RF or IF. (Input signal should be RF [Tuning frequency] or fo of the discriminator using IF (10.7 MHz) and input more than 60 dB μ .)

2) How to Deal with pin 4 After Adjustment.

With the use of a stereo indicator.

When Vcc is 3 V or more, insert a bypass resistance R to prevent LED malfunction.

Without the use of a stereo indicator.

Turn pin 4 to open or connect to GND.

3) Control Resistor of VCO Oscillation Frequency

For the VCO control resistor of this iC, a carbon film resistor suffices. For easier adjustment of temperature characteristics and VCO free run frequency, the following combination is recommended.

2. MPX circuit

1) MPX load resistance

When power supply voltage is over 3 V, change the MPX load resistor R6, R7 from 3.3 kΩ to 6.8 kΩ. In this case, the output level is increased by about 6 dB.

2) Time constant of de-emphasis

Refer to the following table as the time constant is determined at C13, C14, R6 and R7.

	3.3 kΩ	6.8 kΩ	R6, R7
50 μs	0.015 μF	0.0082 μF	C13, C14
75 μs	0.022 μF	0.012 μF	

3. AFC circuit

1) This IC has a built-in variable capacitances.

Change to the following circuit when designing J band, because the standard circuit is for W band.

2) AFC pull-in range is expanded by increasing the capacitance of standard circuit C7 3 pF.

Adjust the value of capacitance according to the set specification.

4. Auto blend circuit

This IC has a built-in auto blend circuit and a MONO switch is not required as a rule. This circuit controls the separation in proportion to the signal level and reduces noise automatically for stereo reception below the mid electric field when the electric field strength reaches lower than about 40 dBμ. When the electric field strength turns below 10 to 15 dBμ, MONO operation is automatically activated.

To switch MONO mode on externally, ground pin 3 with 33 kΩ.

5. FM discriminator

For FM detection, the quadrature detection system is adopted. As a phase shifter, a ceramic resonator (CF 3 discriminator) applies to achieve adjustment-free detection. Though the sensitivity and selectability will be slightly affected, the discriminator can be replaced by a coil as shown below. Combining CF2 (FMIF) and CF3 (PM discriminator) poses problems with the distortion factor when deviation with the IF band central frequency f_0 occurs. To this effect, use pairs of the same rank as indicated in the chart.

	f_0 of CF2 and CF3
A Red	10.70 MHz
B Blue	10.67 MHz
C Orange	10.73 MHz
D Black	10.64 MHz
E White	10.76 MHz

6. FM muting circuit

This IC has a built-in soft muting circuit.

As shown in the following I/O characteristics diagram, 23 dB (Typ.) muting is applied and noise level reduced during weak electric field and out of tune instances.

7. Notes on patterns

1) Positions of FM ANT and OSC coils

Locate those at right angles to each others to avoid inductance M through coupling. Further, insert a pin 21 pattern between patterns of pins 22, 20 and coils.

2) Tuning circuit

As the capacitances C1 to C4, L2 and L3 are the constants on the standard circuit board, check the constants when a new circuit board is used.

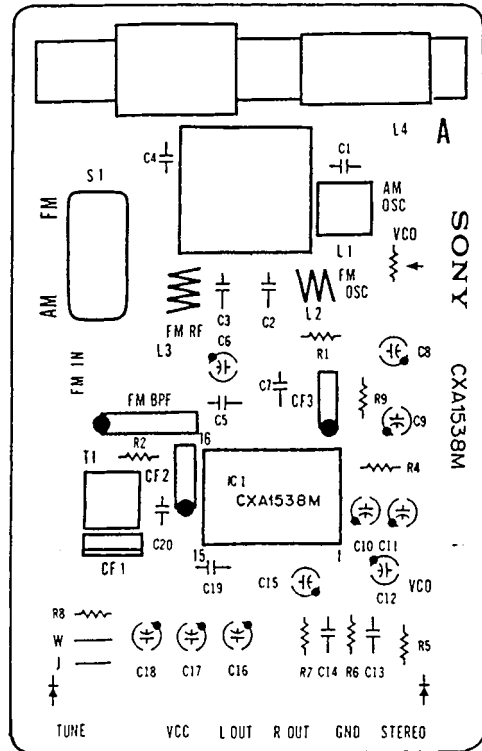

3) Grounding pins

Pin 17 is a grounding pin for AM, FM and FE ; pin 11 for IF ; and pin 30 for MPX. Use as thick as possible a pattern since the grounding between ANT IN, BPF and pin 17 significantly stability, NF and characteristics affects.

4) Ground bypass capacitors C5 (0.001 μF) and C6 (10 μF) connected to pin 21 as close as possible to pin 17.

CXA1538M

CXA1538S

Package Outline Unit : mm

CXA1538M

30PIN SOP(PLASTIC)

PACKAGE STRUCTURE

SONY CODE	SOP-30P-L03
EIAJ CODE	SOP030-P-0375
JEDEC CODE	

PACKAGE MATERIAL	EPOXY RESIN
LEAD TREATMENT	SOLDER PLATING
LEAD MATERIAL	COPPER ALLOY
PACKAGE MASS	0.7g

CXA1538N

30PIN SSOP (PLASTIC)

NOTE: Dimension "*" does not include mold protrusion.
