# 133-MHz Spread Spectrum Clock Synthesizer/Driver with Differential CPU Outputs

**CY28329**

## Features

- Multiple output clocks at different frequencies
  - Four pairs of differential CPU outputs, up to 133 MHz
  - Ten synchronous PCI clocks, three free-running
  - Six 3V66 clocks
  - Two 48-MHz clocks
  - One reference clock at 14.318 MHz
  - One VCH clock
- Spread Spectrum clocking (down spread)
- Power-down features (PCI\_STOP#, PD#)
- Three Select inputs (Mode select & IC Frequency Select)
- OE and Test Mode support
- 56-pin SSOP package and 56-pin TSSOP package

## Benefits

- Motherboard clock generator
- Support Multiple CPUs and a chipset
- Support for PCI slots and chipset
- Supports AGP and Hub Link
- Supports USB host controller and graphic controller
- Supports ISA slots and I/O chip
- Enables reduction of EMI and overall system cost
- Enables ACPI compliant designs
- Supports up to four CPU clock frequencies
- Enables ATE and “bed of nails” testing
- Widely available, standard package enables lower cost

**Notes:**

1. TCLK is a test clock driven in on the XTALIN input in test mode.
2. "Normal" mode of operation.
3. Range of reference frequency allowed is min. = 14.316 nominal = 14.31818 MHz, max. = 14.32 MHz.
4. Frequency accuracy of 48 MHz must be +167 PPM to match USB default.
5. Required for board level "bed of nails" testing.
6. Mid is defined a Voltage level between 1.0V and 1.8V for 3 level input functionality. Low is below 0.8V. High is above 2.0V.

## Serial Data Interface (SMBus)

To enhance the flexibility and function of the clock synthesizer, a two-signal SMBus interface is provided according to SMBus specification. Through the Serial Data Interface, various device functions such as individual clock output buffers, etc. can be individually enabled or disabled. CY28329 support both block read and block write operations.

The registers associated with the Serial Data Interface initializes to its default setting upon power-up, and therefore use of this interface is optional. Clock device register changes are normally made upon system initialization, if any are required. The interface can also be used during system operation for power management functions.

### Data Protocol

The clock driver serial protocol accepts only Block Writes from the controller. The bytes must be accessed in sequential order from lowest to highest byte, (most significant bit first) with the ability to stop after any complete byte has been transferred. Indexed bytes are not allowed.

**Figure 1. An Example of a Block Write**

**Notes:**

8. All parameters specified with loaded outputs.
9. Duty cycle is measured at 1.5V when  $V_{DD} = 3.3V$ . When  $V_{DD} = 2.5V$ , duty cycle is measured at 1.25V.
10. POR starts when  $V_{DD}$  reaches 1.5V.
11. All PULL-UPS must ramp at the same rate as  $V_{DD}$ .
12. Determined as a fraction of  $2^*(Trp - Trn)/(Trp + Trn)$  Where Trp is a rising edge and Trn is an intersecting falling edge.
13. The test load is  $R_s = 33.2\Omega$ ,  $R_p = 49.9\Omega$  in test circuit.
