## 1:4 Clock Fanout Buffer

### Features

- Low voltage operation
- $V_{DD} = 3.3V$
- 1:4 fanout
- Single-input configurable for LVDS, LVPECL, or LVTTL
- Four differential pairs of LVPECL outputs
- Drives 50-ohm load
- Low input capacitance
- Low output skew
- Low propagation delay
  - Typical ( $tpd < 4$  ns)
- Industrial versions available
- Available packages include TSSOP, SOIC

### Description

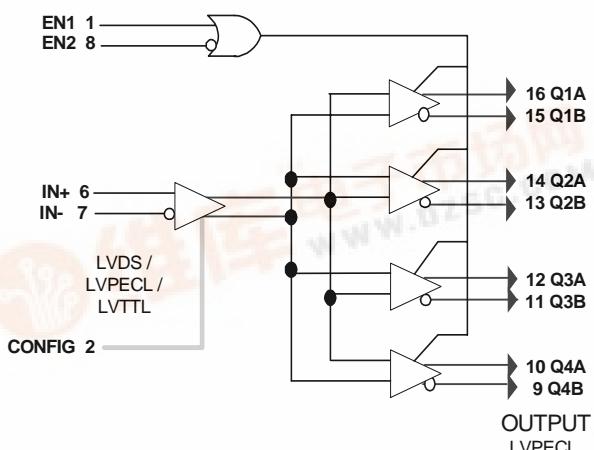

The Cypress CY2 series of network circuits are produced using advanced 0.35-micron CMOS technology, achieving the industry's fastest logic.

The Cypress CY2DP814 fanout buffer features a single LVDS- or a single LVPECL-compatible input and four LVPECL output pairs.

Designed for data communications clock management applications, the fanout from a single input reduces loading on the input clock.

The CY2DP814 is ideal for both level translations from single-ended to LVPECL and/or for the distribution of LVDS-based clock signals. The Cypress CY2DP814 has configurable input between logic families. The input can be selectable for an LVPECL/LVTTL or LVDS signal, while the output drivers support LVPECL capable of driving 50-ohm lines.

Notes:

- Stresses greater than those listed under absolute maximum ratings may cause permanent damage to the device. This is intended to be a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operation sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- Multiple Supplies: The voltage on any input or I/O pin cannot exceed the power pin during power-up. Power supply sequencing is NOT required.

3. RL = 50 ohm ± 1%; Zline = 50 ohm 6 = 0.
4. CL includes instrumentation and fixture capacitance within 6 mm of the UT.
5. TPA and B are used for prop delay and rise/fall measurements. T<sub>PC</sub> is used for V<sub>OC</sub> measurements only and otherwise connected to V<sub>DD</sub> – 2V.
6. When measuring Tr/Tf, tpd, V<sub>OP</sub> point T<sub>PC</sub> is held at V<sub>DD</sub> – 2.0V.
7. LVCMS/LVTTL single-ended input value. Ground either input: when on the B side, non-inversion takes place. If A side is grounded, the signal becomes the complement of the input on B side. See Table 3.
