NC7SZ66

TinyLogic® Low Voltage UHS Single SPST Normally Open Bus Switch

General Description

The NC7SZ66 is a ultra high-speed (UHS) CMOS compatible single-pole/single-throw (SPST) bus switch. The LOW On Resistance of the switch allows inputs to be connected to outputs with minimal propagation delay and without generating additional ground bounce noise. The device is organized as a 1-bit switch with a switch enable (OE) signal. When OE is HIGH, the switch is on and Port A is connected to Port B. When OE is LOW, the switch is open and a high-impedance state exists between the two ports.

Features

- Space saving SOT23 or SC70 5-lead package
- Ultra small MicroPak™ leadless package
- Broad V_{CC} Operating Range 1.65V–5.5V
- Rail-to-rail signal handling
- 5Ω switch connection between two ports
- Minimal propagation delay through the switch
- Low I_{CC}
- Zero bounce in flow-through mode
- Control input compatible with CMOS input levels

Note 1: The "Absolute Maximum Ratings" are those values beyond which the safety of the device cannot be guaranteed. The device should not be operated at these limits. The parametric values defined in the Electrical Characteristics tables are not guaranteed at the absolute maximum ratings. The "Recommended Operating Conditions" table will define the conditions for actual device operation.

Note 2: The input and output negative voltage ratings may be exceeded if the input and output diode current ratings are observed.

Note 3: Unused inputs must be held HIGH or LOW. They may not float.

The diagram illustrates the timing characteristics of a CMOS inverter. The top waveform, labeled "SWITCH INPUT", is a trapezoidal pulse with a rise time $t_r = 2.5 \text{ ns}$ and a fall time $t_f = 2.5 \text{ ns}$. The pulse levels are defined by 10%, 50%, and 90% voltage points. The input signal is connected to the gate of the inverter, which is also connected to V_{CC} and GND. The bottom waveform, labeled "OUTPUT", is the inverted output signal, showing a delay relative to the input. Key timing parameters for the output are t_{PLH} (propagation delay from low to high), t_{PHL} (propagation delay from high to low), and t_W (pulse width at 50% level). The output signal levels are marked as V_{OH} and V_{OL} .
